

Plan for Joint JetMET/EWK Physics Analysis Summary

Performance of Missing Transverse Energy Reconstruction in events from pp collision data with $\sqrt{s} = 7$ TeV containing electroweak bosons.

Stefano Lacaprara¹ and **Artur Apresyan²**

¹INFN Padova, ²CALTECH

JetMet meeting
CERN, 19-Apr-2010

The task

Performance of Missing Transverse Energy Reconstruction in events from pp collision data with $\sqrt{s} = 7$ TeV containing EWK bosons.

- MET Commissioning in events where true MET is present.
- Similar work in multijets/Susy/... events by MET group (see previous talks)
- Select W and Z in electron and muon channel, following recipes from VBTF.
- Study MET(s) (Calo - raw and Type-I, Type-II corrected -, Tc, PF, ...) for W events;
- Study MET(s) in Z events with and w/out one lepton removed;
- If possible, study also W+N-jets events;
- Also high-pt isolated photons.
- Following plots taken from past presentation, linked from TWiki page <https://twiki.cern.ch/twiki/bin/view/Main/MSEWKMETCommissioningThoughts>

- Standard dataset selection;
- the object of the PAS is not to study VB events as such but to look at MET in those events;
- Follow recipes from relevant DPG/POG/PAG;
- Need a uniform definition of basic object (lepton, jets, MET types, MET corrections, ...)
- event cleaning (ECAL spikes, HCAL noise, monster events, ...) should be uniform across analysis as well;
- will collect technicalities about VB baseline selections, MET definitions and such in the TWiki page;

W Events - after a tight selection but loose cut on MET

- both electron and muon channel
- how well does the shape of the MET distribution in the MC match real data?
 - demands control of the background as well
 - critical: position and shape of the peak (maybe better to look at MT)
 - check the tail to the high end
 - check events with a jet veto - probes the lepton contribution
 - check events with an energetic jet - probes the jet contribution
- what is the composition (thinking of PF) ?
- Compare CaloMET, tcMET and PFMET on an event-by-event basis
 - examine events in which differences are large - is there any sign of an error?
 - are there events in which one method gives an unusually high value?
 - if so, what is the reason?

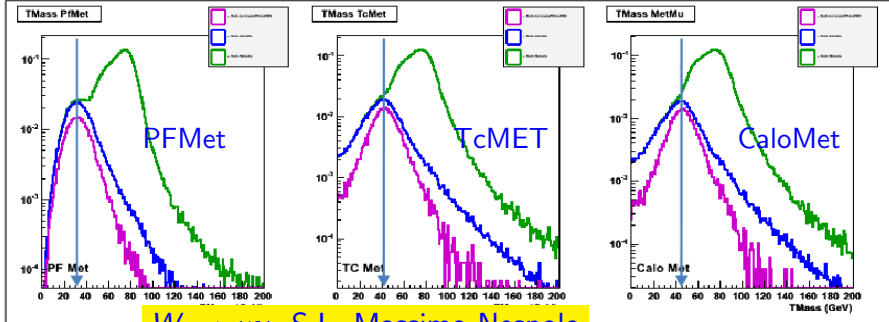

$$W \rightarrow e\nu$$

Nikolaos Rompotis

$W \rightarrow \mu\nu$ S.L. Massimo Nespolo

PfMet vs threshold vs CaloMet

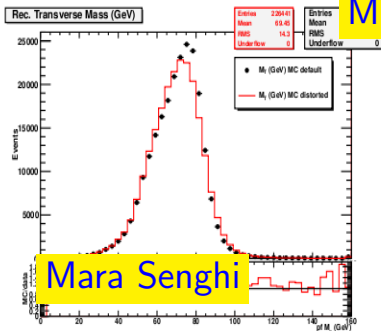

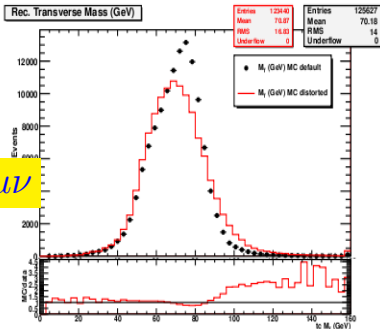

The higher the threshold

The higher the PF Met

$W \rightarrow \mu \nu$

MT distortion due to *realistic* μ

M_T from Calo and TC
(above) PF MET (below)

**** Large effects ****

data will tell if μ -distortion is
needed and its magnitude

Mara Senghi

Z Events - should already be very clean

- both electron and muon channel
- compare the MET distribution data/MC
 - check events with a jet veto - probes the lepton contribution
 - check events with an energetic jet - probes the jet contribution
 - what is the composition (thinking of PF) ?
 - are the parallel and perpendicular (response vs noise) components of the hadronic part well simulated?
 - which MET is best (has the best resolution)?
- Since there is no intrinsic MET component for Z events, we can use them to make a data-driven comparison.
 - Drop one of the leptons and recalculate the MET. Compare to the value before dropping the lepton.
 - Rescale for M_Z/M_W and compare with $W \rightarrow l\nu$ MET;
 - Which MET has the narrowest distribution of the difference?
 - Is the distribution of the difference well simulated?
- Derive MET corrections for MET in $W \rightarrow l\nu$ from $Z \rightarrow ll$ by dropping one lepton using Data. AN2009_092
- Try to use also J/ψ candidates?

$$W \rightarrow \mu\nu$$

M_T template for $W \rightarrow \mu\nu$ using $Z \rightarrow \mu\mu$, μ removed and M_Z/M_W rescale

Maria Cepeda et al

$Z/\gamma^* \rightarrow \mu\mu + 1 \text{ jets}$

Florent Lacroix

TMass: 1 jet

$W \rightarrow \mu\nu + 1 \text{ jets}$

Massimo Nespolo

High pt isolated photons + jet

- γ measured by ECAL, no physical MET in the event
 - study MET scale;
 - compare MET(s);
 - compare recoil with photon;
 - magnitude and direction;
- how well does the shape of the MET distribution in the MC match real data?
- what is the composition (thinking of PF) ?
- are the parallel and perpendicular components of the hadronic part (U_{perp} and U_{parallel}) well simulated?
- which MET is best (has the best resolution)?

$$\text{Recoil [GeV]} = \text{MET} + p_{T\gamma}$$

$$\gamma + \text{jet}$$

Parallel Recoil Pt vs Photon Pt

Jordan Damgov

Goal is to have PAS ready for ICHEP (22-27 July)

WEEK	Monday	Meeting	Event		
4	19-APR	JetMET	Todays meeting		
5	26-APR				
6	03-MAY	JetMET	TrackJet Commissioning JME-10-006 Pre-Approval in JetMET May-03		
7	10-MAY				
8	17-MAY	Phys Week	Freeze Data 17-MAY	Summaries of all PAS analyses	
9	24-MAY		AN and PAS 24-MAY		
10	31-MAY	JetMET	Pre-approval 31-MAY	Freeze Data 31-MAY	
11	07-JUN		ARC gives OK 9-JUN	AN and PAS 07-JUN	
12	14-JUN	CMS Week	Approval 16-JUN	Pre-approval 15-JUN	Freeze Data 14-JUN
13	21-JUN		Jet PAS: JME-10-003	ARC gives OK 23-JUN	AN and PAS 21-JUN
14	28-JUN	JetMET		Approval 30-JUN	pre-approval 28-JUN
15	05-JUL			SUSY MET PAS: JME-10-004	ARC gives OK 7-JUL
16	12-JUL	JetMET			Approval 14-JUL
17	19-JUL		ICHEP 21-JUL		EWK MET PAS:

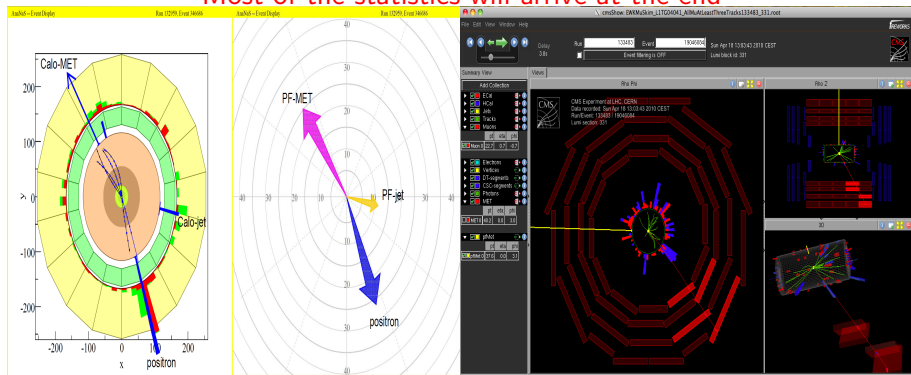

Activy must start NOW and will last up to begin of summer

Luminosity and statistics

date	$\int \mathcal{L} dt$	$W \rightarrow l\nu$	+1jet ($> 25 \text{ GeV}$)	$Z \rightarrow ll$	+1jet ($> 25 \text{ GeV}$)
today	0.26 nb^{-1}	$\mathcal{O}(1)$	$\mathcal{O}(0)$	$\mathcal{O}(0)$	$\mathcal{O}(0)$
end april	$\sim 0.5 \text{ pb}^{-1}$	$\mathcal{O}(1500)$	$\mathcal{O}(500)$	$\mathcal{O}(150)$	$\mathcal{O}(50)$
end may	$\sim 1.5 \text{ pb}^{-1}$	$\mathcal{O}(4500)$	$\mathcal{O}(1500)$	$\mathcal{O}(400)$	$\mathcal{O}(100)$
mid june	$\sim 3.0 \text{ pb}^{-1}$	$\mathcal{O}(10000)$	$\mathcal{O}(3000)$	$\mathcal{O}(1000)$	$\mathcal{O}(300)$

Most of the statistics will arrive at the end

Contributors

Work division VERY preliminary

- $W \rightarrow \mu\nu, Z \rightarrow \mu\mu$ Mara Senghi Soares, Carmen Diez, Massimo Nespolo, Stefano Lacaprara, Sara Vanini, Antonio Branca,
 $W \rightarrow e\nu, Z \rightarrow ee$ Michail Bachtis, Kira Grogg, Chiara Rovelli, Emanuele Di Marco, Matthieu Marionneau, David Wardrope, Robin Nandi, Phil Duerdo (?)
- $W's$ Meenakshi Narain, Gena Kukartsev, Michael Segala, Lawrence Gibbons, Aleko Khukhunaishvili, Jim P Alexander, Freya Blekman
- $Z's$ Florent Lacroix, Ulla Gebbert
- γ Jordan Damgov, Sungwon Lee
- MET decomposition with $W's$ Chris Rogan, Artur Apresyan, Maria Spiropulu, Yi Chen
- PfMET in $W's$ Gennai Simone, Alexander Savin, Michalis Bachtis

If you are not in the list but wish to contribute,
please get in contact with us

Plan

- Interested in work that can be completed by the PAS deadline
- Likely will have most of EWK candidate rather at the end, close to the PAS deadline;
- Start with MC studies, prepare PAS plots ready to be filled with increasing statistics for data;
- Start asap at looking at MET in real EWK candidates event-by-event;
- Fill distribution with available statistics as candidates are collected;
- by May 17th we need to show preliminary results on the work

Documentation

TWiki available at

<https://twiki.cern.ch/twiki/bin/view/Main/MSEWKMETCommissioningThoughts>
will be kept up-to-date
