3-14 /01/ 2006

Results from BABAR & Comparison with Other Experiments

Outline:

- ★ The Physics Program
- ★ The CKM Matrix and the Unitary Triangle
- ★ The Unitary Triangle by Sides
- ★ The Unitary Triangle by Angles
- ★ Search for N.P. & Constraints on the SM
- ★ The Unexpected
- ★ Conclusions & Perspectives

BABAR Physics Program

Study the flavor sector of the S.M. and search for new physics:

- Unitary Triangle
- CP Violation in B decays
- rare processes involving B,D mesons and τ leptons

A Disclaimer:

- BABAR and Belle released more than 300 articles to-date
- Many very interesting measurements ~ constant publishing rate
- Will only highlight the most important (based on my own judgment)

TOPICS:

- ★ The Physics Program
- ★ **The CKM Matrix and the Unitary Triangle**
- ★ The Unitary Triangle by Sides
- ★ The Unitary Triangle by Angles
- ★ Search for N.P. & Constraints on the SM
- ★ The Unexpected
- ★ Conclusions & Perspectives

The CKM matrix

- Expresses in the Standard Model the coupling between quarks of different flavour
- Only four independent parameters, three Euler's angles and **one phase**

$$V_{CKM} = \begin{bmatrix} V_{ud} & V_{us} & V_{ub} \\ V_{cd} & V_{cs} & V_{cb} \\ V_{td} & V_{ts} & V_{tb} \end{bmatrix}$$

- CKM paradigm :

All CP violating phenomena in transitions between hadrons are described in terms of a unique parameter, the CKM phase

The Wolfenstein Parameterization

$$V_{CKM} \simeq \begin{bmatrix} 1-\lambda^2/2 & \lambda & A\lambda^3(\rho+i\eta) \\ -\lambda & 1-\lambda^2/2 & A\lambda^2 \\ A\lambda^3(1-\bar{\rho}+i\bar{\eta}) & -A\lambda^2 & 1 \end{bmatrix}$$

$$\lambda = \sin \theta_C = 0.2258 \pm 0.0011$$

$$A, \rho, \eta = o(1)$$

$$\bar{\rho} = \rho \cdot (1 - \lambda^2/2)$$

$$\bar{\eta} = \eta \cdot (1 - \lambda^2/2)$$

- An approximation, precise to $o(\lambda^3)$, underlining the observed (*yet unexplained*) hierarchy of CKM parameters

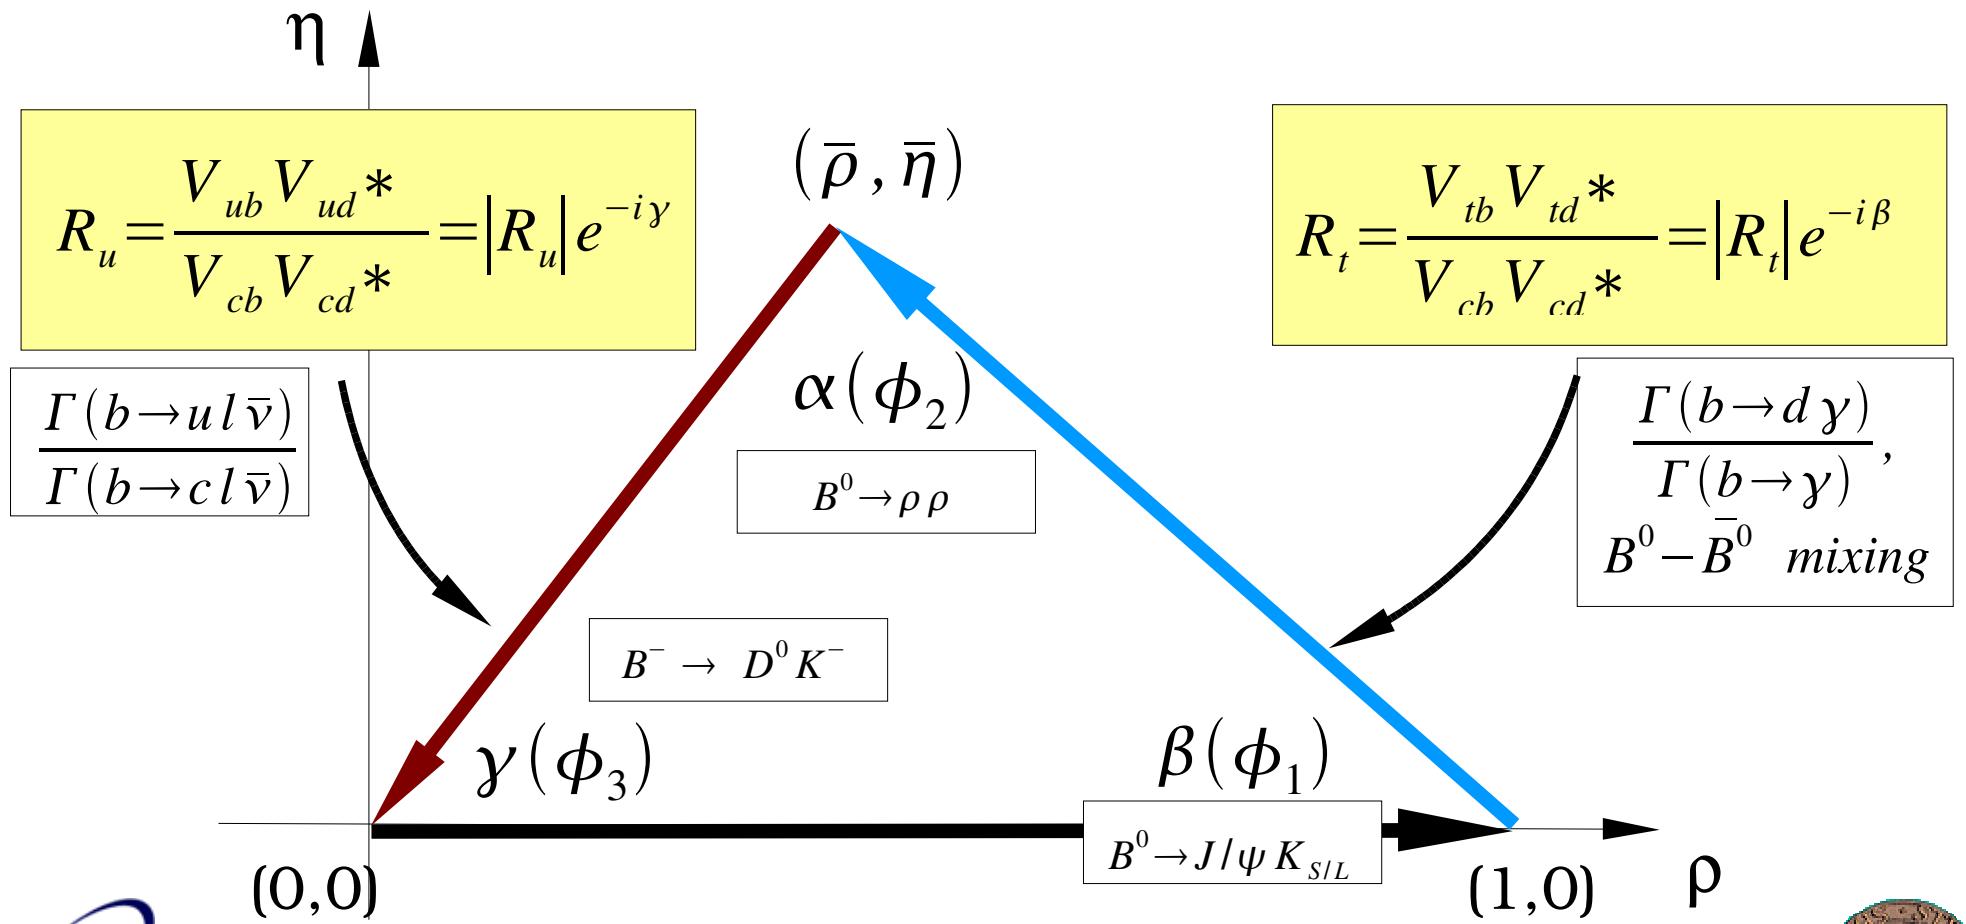

CP Violation : $\eta \neq 0$

CKM and the Unitarity Triangle

- Unitarity Condition:
- Rescaled Triangle:

$$V_{ub} V_{ud}^* + V_{cb} V_{cd}^* + V_{tb} V_{td}^* = 0$$

$$R_u + 1 + R_t = 0$$

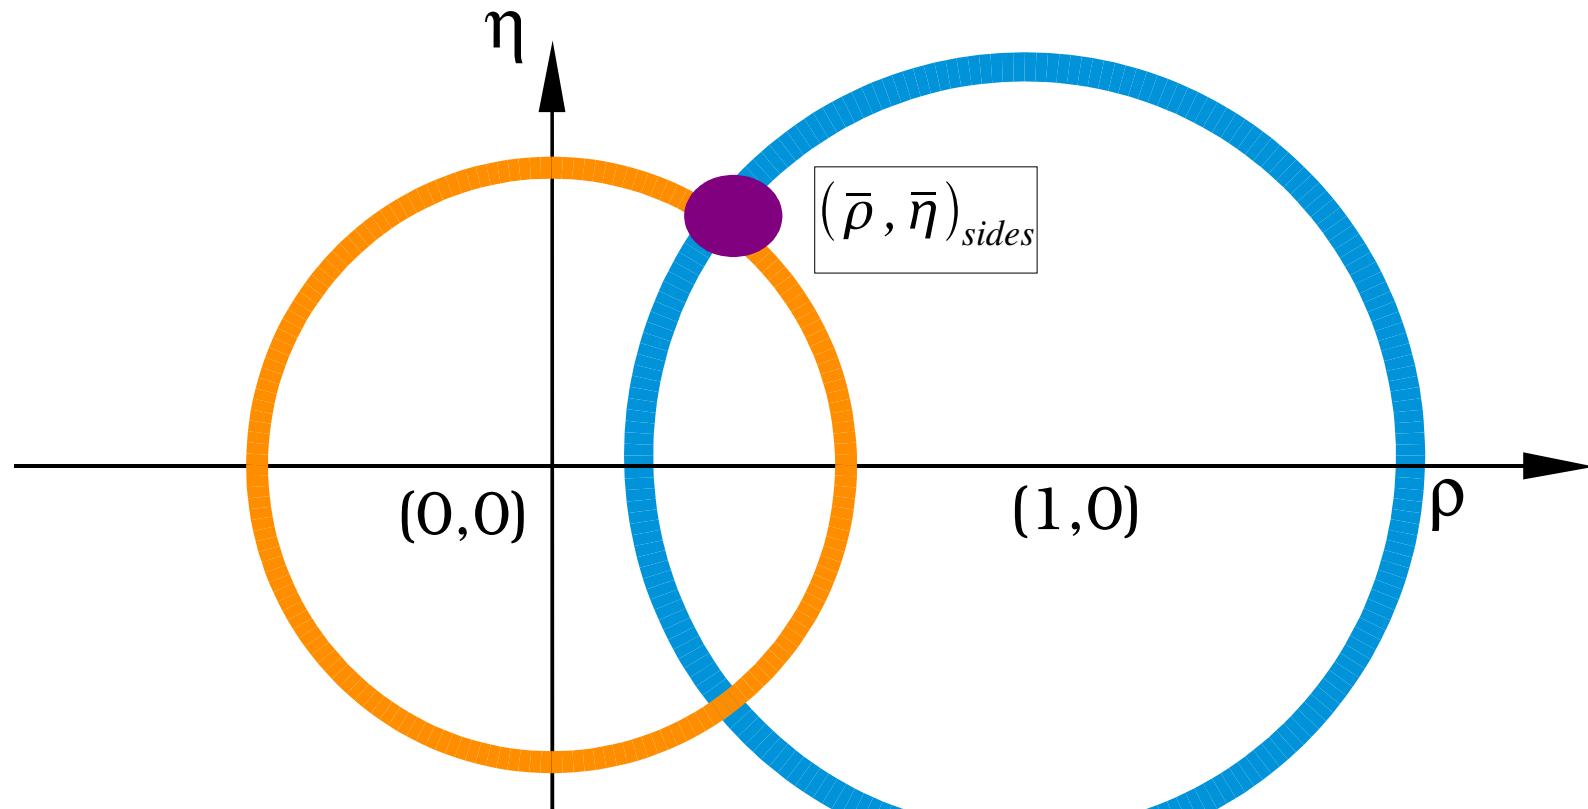

Constraining the UT

- Determine sides and angles of the UT
- Verify consistency, e.g. getting apex coordinates (ρ, η) of UT

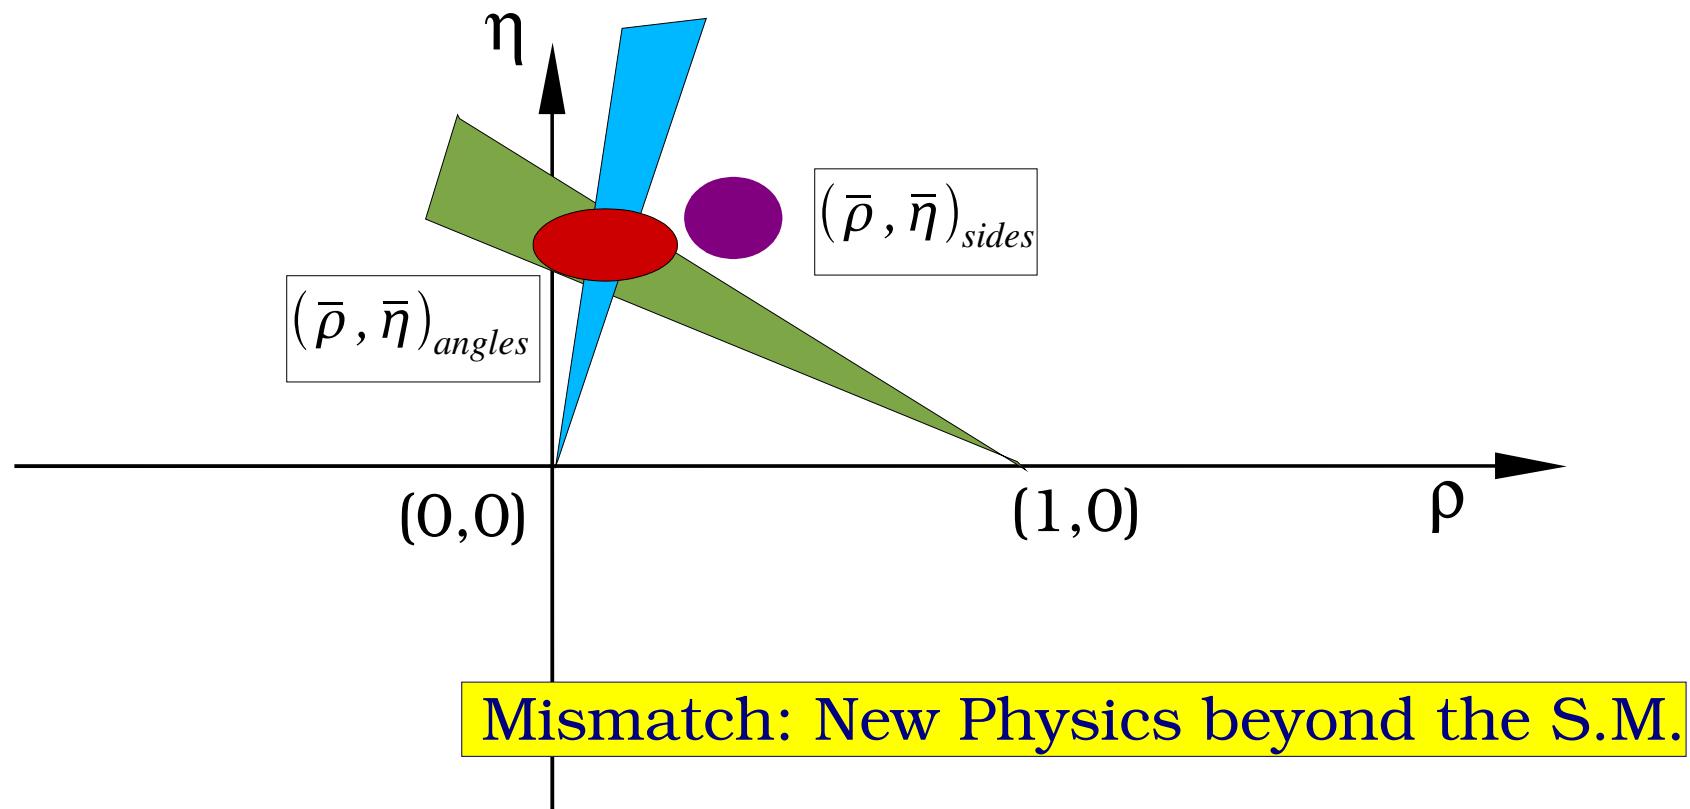

Constraining the UT

- Determine sides and angles of the UT
- Verify consistency, e.g. getting apex coordinates (ρ, η) of UT
 - by intersecting sides ($|R_u|$, $|R_t|$)

- Determine sides and angles of the UT
- Verify consistency, e.g. getting apex coordinates (ρ, η) of UT
 - by intersecting sides ($|R_u|, |R_t|$)
 - by intersecting angles (α, β, γ)

TOPICS:

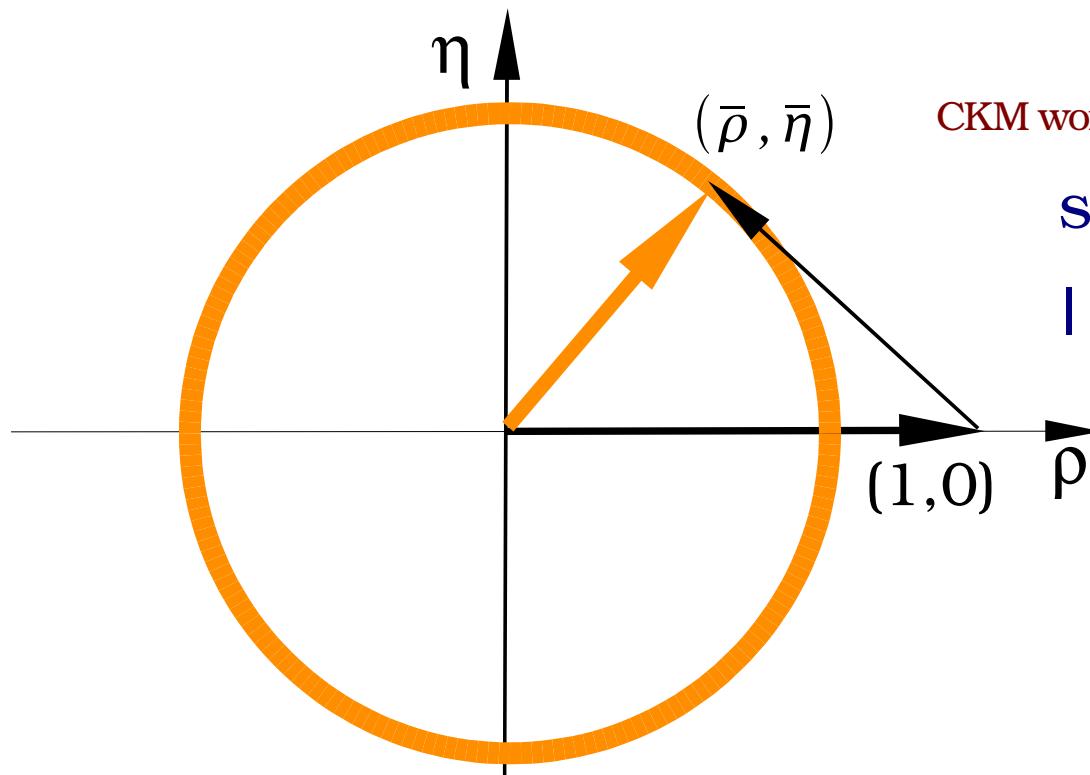

- ★ The Physics Program

- ★ **The Unitary Triangle by Sides**
- ★ The Unitary Triangle by Angles
- ★ Search for N.P. & Constraints on the SM
- ★ The Unexpected
- ★ Conclusions & Perspectives

12

The sides : $|R_u|$

$$|R_u| = \left| \frac{V_{ub} V_{ud}^*}{V_{cb} V_{cd}^*} \right| = \frac{1}{\tan \theta_C} \left| \frac{V_{ub}}{V_{cb}} \right| = \bar{\rho}^2 + \bar{\eta}^2$$

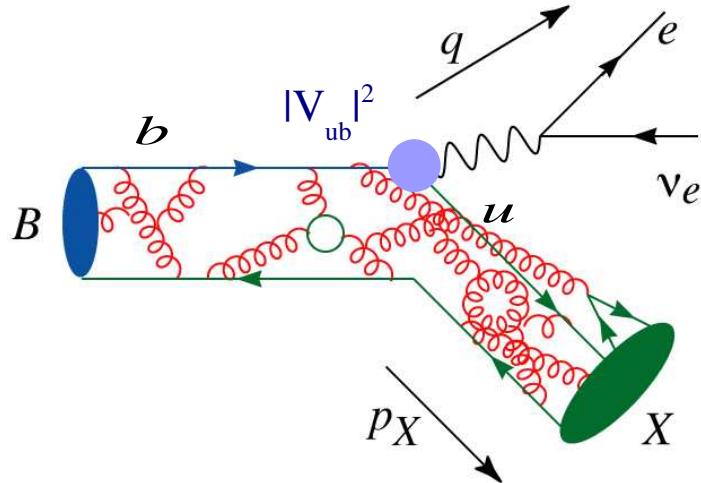

CKM workshop San Diego 2005:

$$\sin \Theta_c = 0.2258 \pm 0.0011$$

$$|V_{cb}| = (41.6 \pm 0.7) \times 10^{-3}$$

Error dominated by $|V_{ub}|$ measurement

Determination of $|V_{ub}|$

$$\Gamma(b \rightarrow u l \bar{\nu}) \propto |V_{ub}|^2$$

OPE : $|V_{ub}|$ from $\Gamma(b \rightarrow ul\nu)$ with 5% error

- Apply hard cuts to reduce $b \rightarrow cl\nu$ background

$$\frac{\Gamma(b \rightarrow cl\bar{\nu})}{\Gamma(b \rightarrow ul\bar{\nu})} \simeq 50$$

- Measure *partial Branching Ratio* ΔBr , get $ul\nu$ decay width

$$\Gamma(b \rightarrow u l \bar{\nu}) = \frac{\Delta Br}{\tau_B} \cdot f_u$$

- Compute acceptance correction f_u using QCD-inspired models, educated by data

$$f_u = \iiint H(q^2, E_l, M_X) \otimes F(\tilde{k} | m_b, \Lambda, \mu_\pi^2, \dots)$$

parton level

non perturbative
“shape function”

f_u depends on non-perturbative parameters

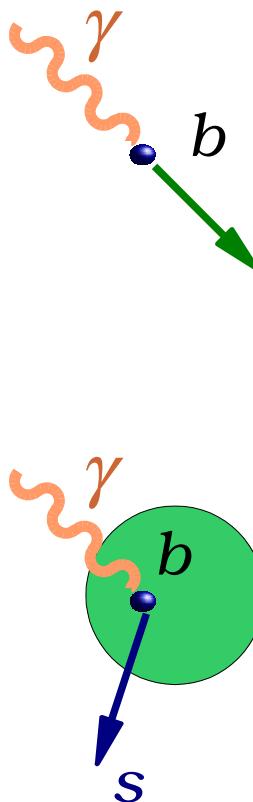

- m_b : *b-quark mass*
- μ_{π}^2 : *b-quark kinetic energy in B hadron rest frame*
- Λ : *motion of the light quark*
- ...

determined in the ansatz of an universal (shape) function from:

- $b \rightarrow s\gamma$ decays
- $b \rightarrow cl\nu$ decays

Measurement of SF parameters from $b \rightarrow s\gamma$

Parton-level :

- b-quark at rest
- two body decay

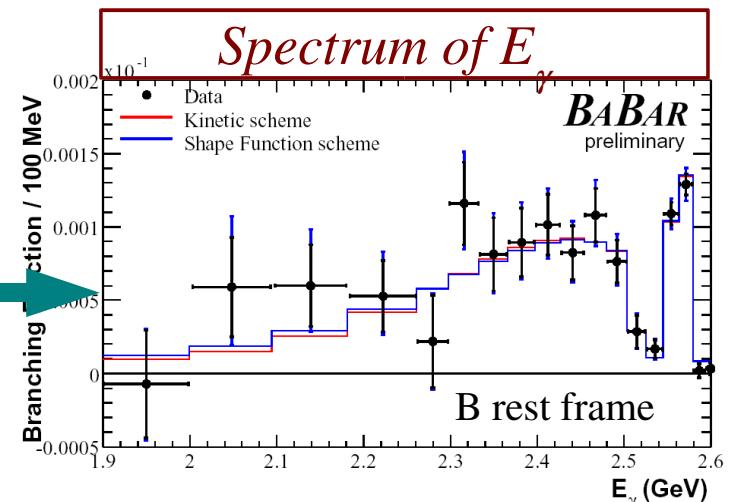

$$E_\gamma = m_b/2$$

"universal" , same also for $b \rightarrow u$

Real life :

- b moves in the B-hadron
- b interacts with light dof
- s hadronizes

non-"universal"

Compute SF from the (moments of) E_γ spectrum in $b \rightarrow s\gamma$ decays:

$$E^{(1)} = \langle E_\gamma \rangle \approx \frac{m_b}{2},$$

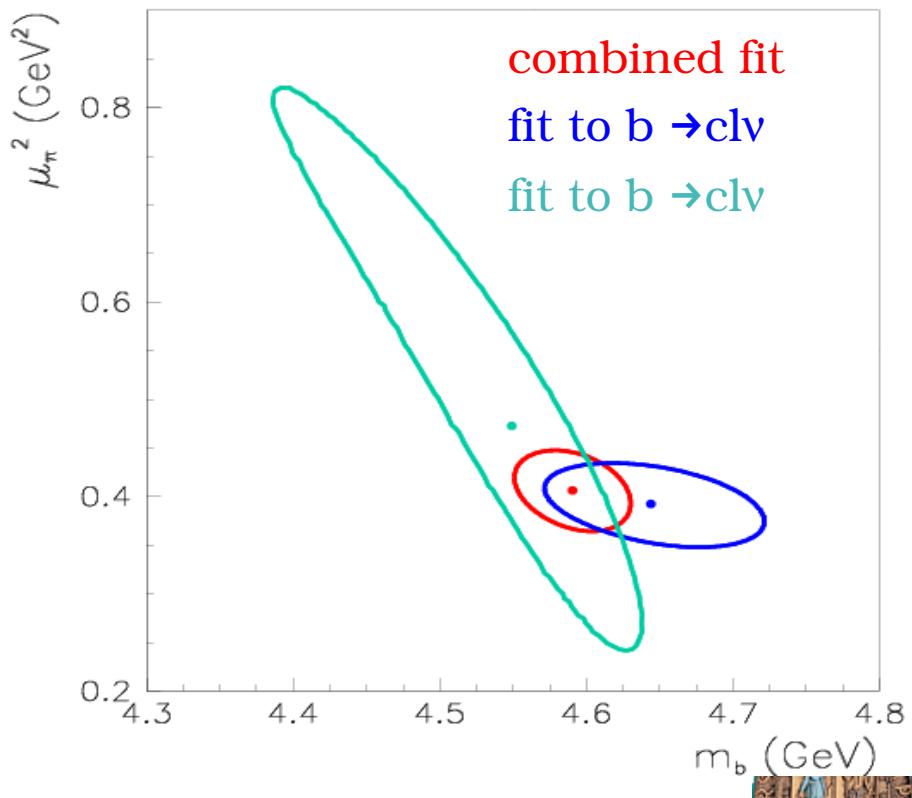

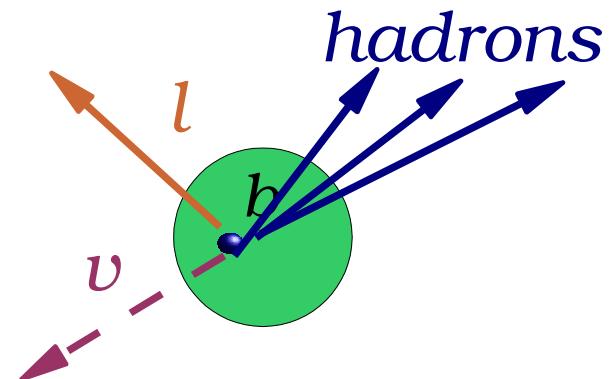

$$E^{(2)} = \langle E_\gamma^2 - \langle E_\gamma^2 \rangle \rangle \approx \mu_\pi \approx E_{kin}(b),$$

...

16 Measurement of SF parameters from $b \rightarrow \text{clv}$

- Non-perturbative effects also affect lepton and hadron spectra in $b \rightarrow \text{clv}$ decays
- Measurement of E_l and M_{hadron} moments allow another determination of Shape Function
- Results are consistent with $b \rightarrow \text{sy}$

Errors on SF parameters:

- experimental (measurement of the moments)
- model : non – universality (sub-leading S.F.) *not shown in the plot*

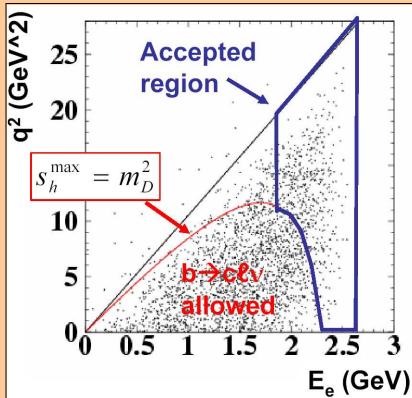

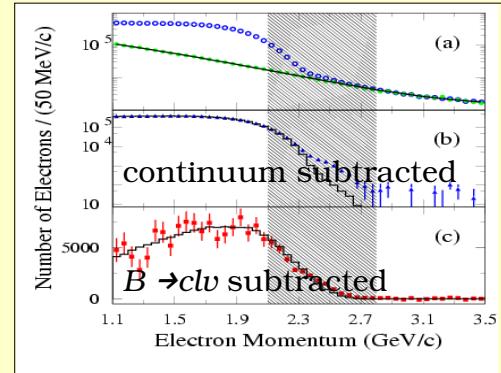

$|V_{ub}|$: inclusive measurements

E_e end point (80 fb^{-1})

CLEO (1994) : $E_e > 2.3 \text{ GeV}$, (c threshold)

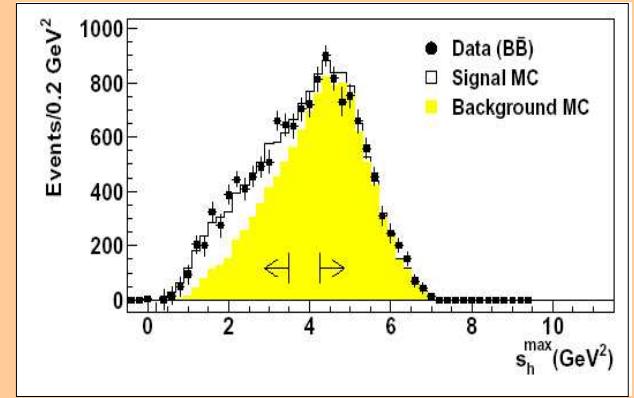

BABAR: $E_e > 2.0$ (↓ model uncertainty)

(Belle $E_e > 1.9$) S/B $\sim 1/14$, $f_u = 0.250 \pm 0.026$

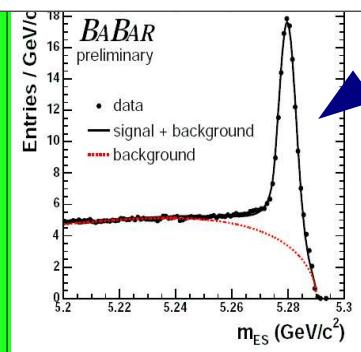

$E_e - q^2$ (80 fb^{-1})

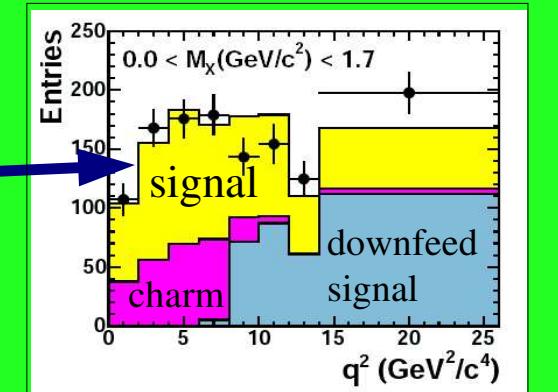

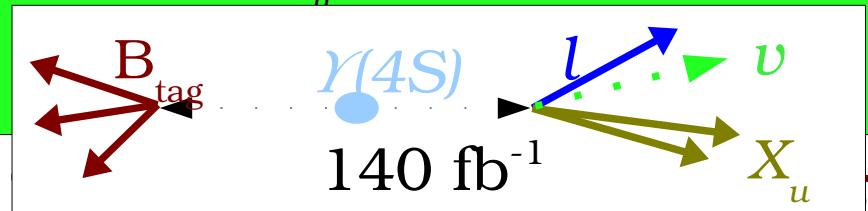

\vec{p}_ν from missing momentum
correlated cut to reduce c
S/B $\sim 1/2$, $f_u = 0.163 \pm 0.012$

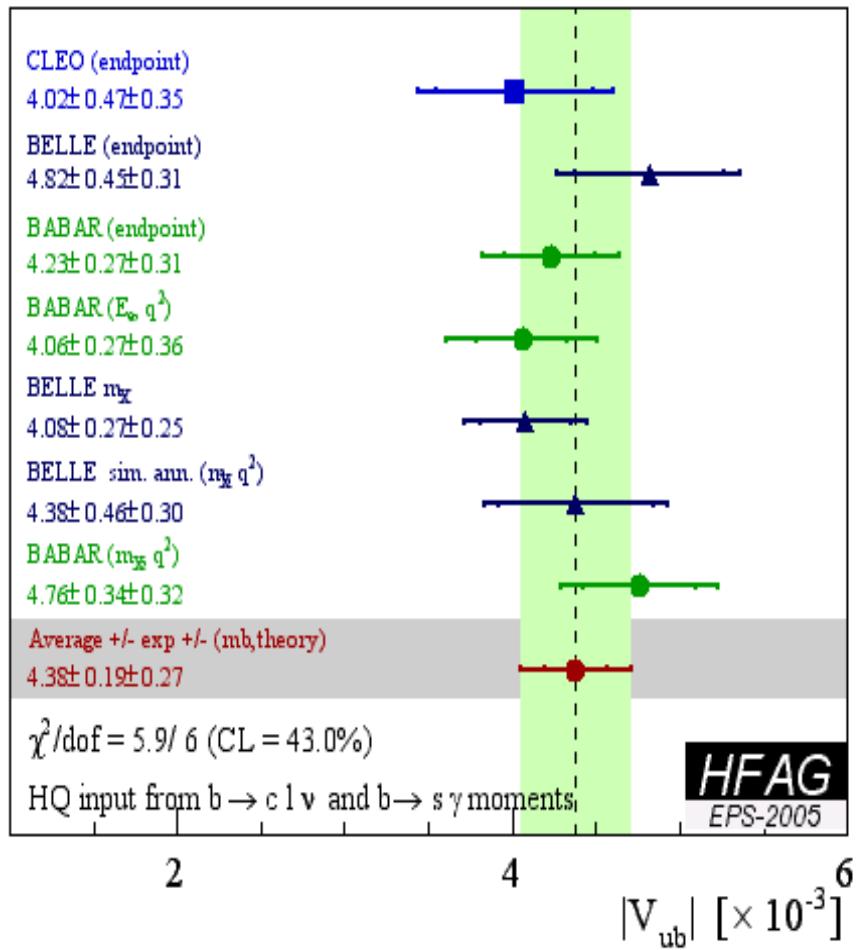

Recoil Hadrons

Fully reconstruct tag B (↓ efficiency)
Mass (M_x) and q^2 of recoil hadrons (X_u)
Count events in *high- q^2 , low- M_x* bin
S/B $> 1/1$, $f_u = 0.300 \pm 0.026$

adova

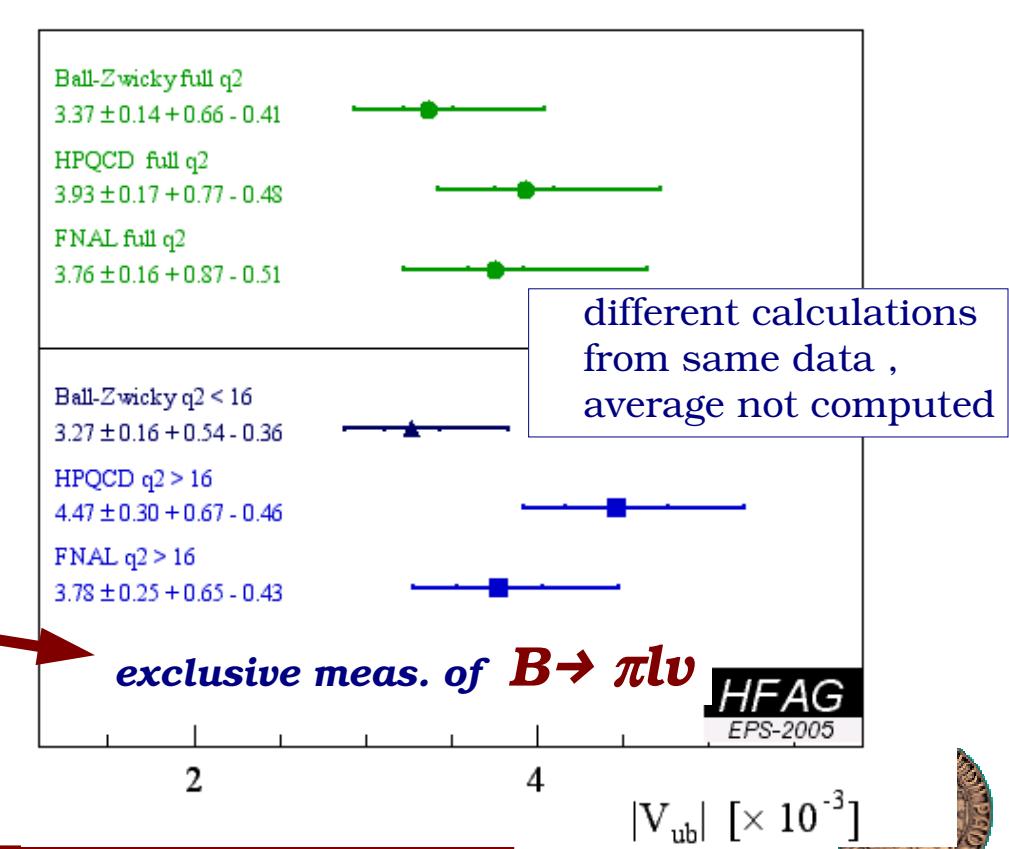

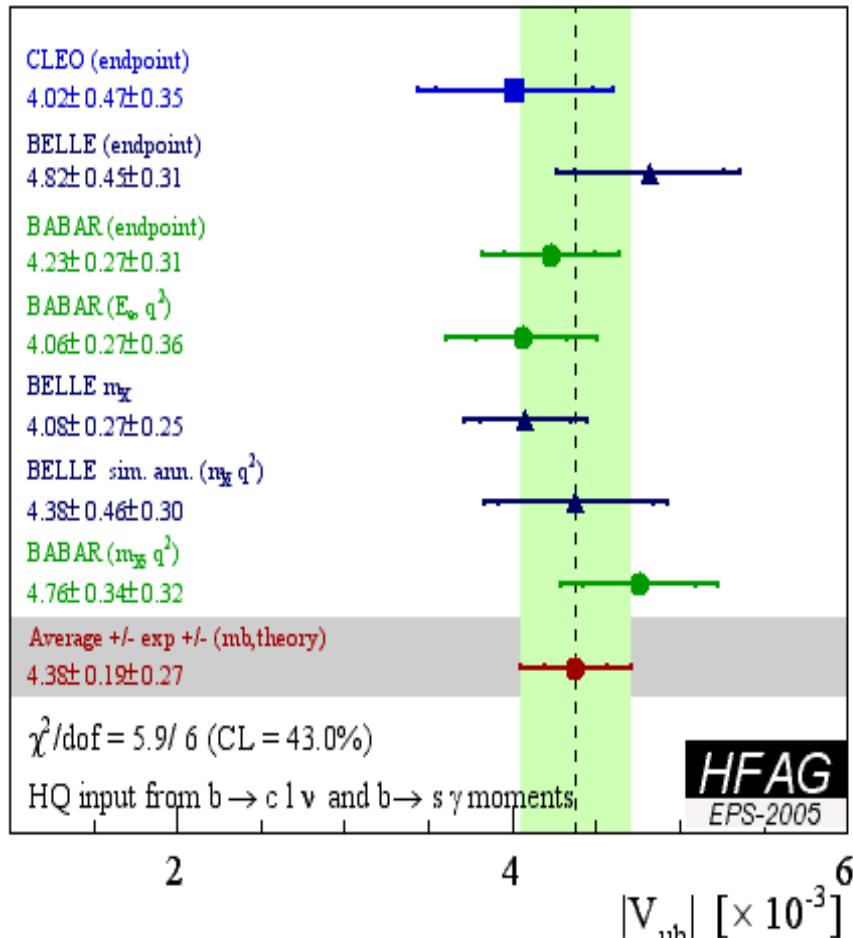

V_{ub} : results & WA

World Average, summer 2005:

$$|V_{ub}| = (4.38 \pm 0.19_{\text{exp}} \pm 0.27_{\text{theo}}) 10^{-3}$$

$$\Delta V_{ub}/V_{ub} = (3.3_{\text{expt}} \oplus 2.9_{\text{model}} \oplus 4.7_{\text{SF}} \oplus 4.0_{\text{theory}})\% = 7.6\%$$

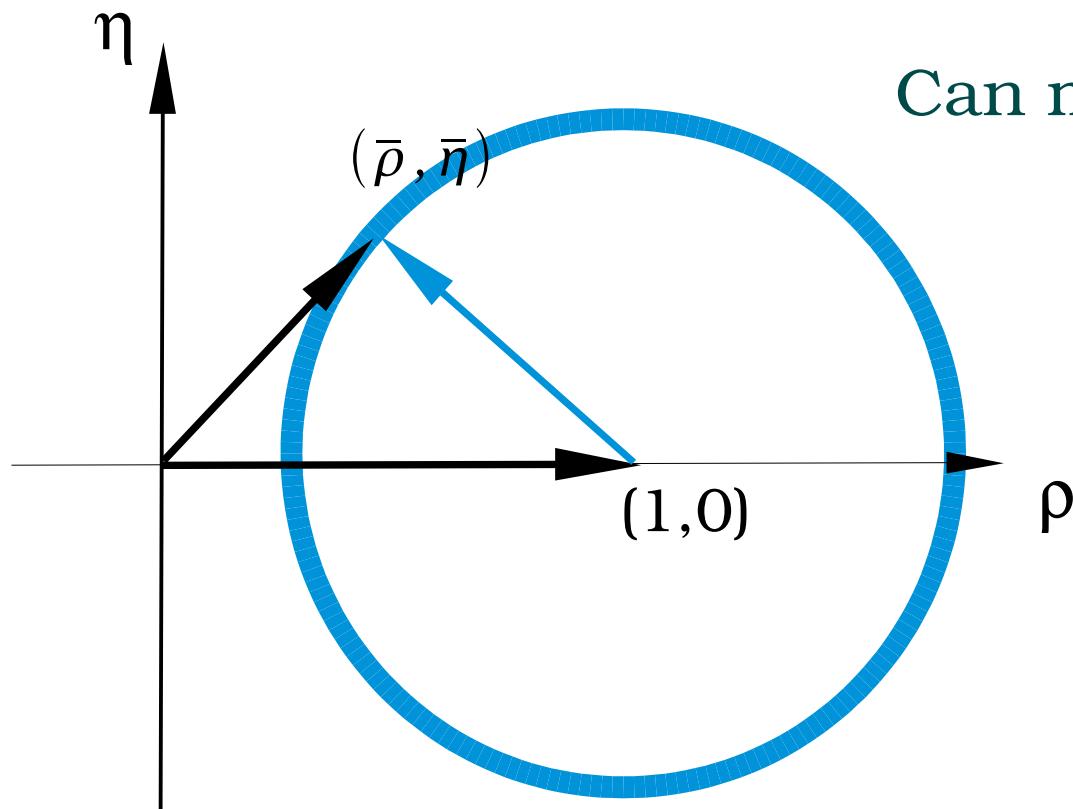

V_{ub} : comparison to exclusive $B \rightarrow \pi l \nu$

20

$$|R_t| = \left| \frac{V_{tb} V_{td}^*}{V_{cb} V_{cd}^*} \right| = \frac{1}{\sin \theta_c} \left| \frac{V_{td}}{V_{cb}} \right| = (1 - \bar{\rho})^2 + \bar{\eta}^2$$

The sides : $|R_t|$

Can measure $|V_{td}|$ from :

$B^0 \bar{B}^0$ mixing

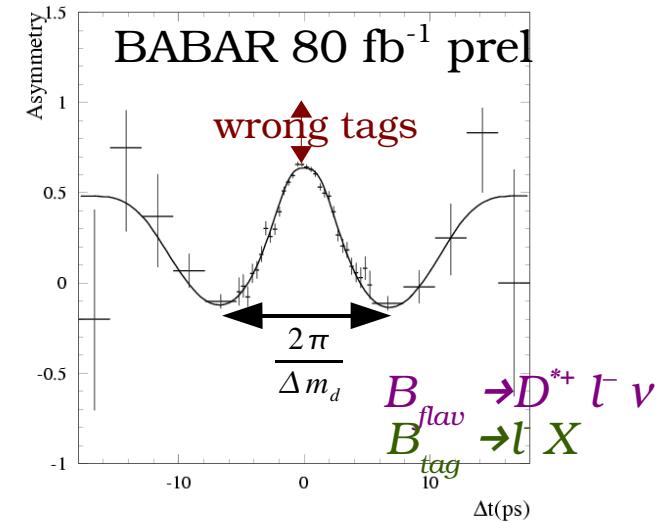

$\frac{\Gamma(b \rightarrow d \gamma)}{\Gamma(b \rightarrow s \gamma)}$

2: $\Delta m_d = \frac{G_F^2}{6\pi^2} m_{B_d} (\hat{B}_{B_d} F_{B_d}^2) \eta_B m_W^2 S_0(x_t) |V_{td}|^2$ | V_{td} | from Δm_d

Time dependent flavor asymmetry :

$$\cos(\Delta m_d \Delta t) = \frac{N(B^0 \bar{B}^0) - N(B^0 B^0)}{N(B^0 \bar{B}^0) + N(B^0 B^0)}(\Delta t)$$

2: $\Delta m_d = \frac{G_F^2}{6\pi^2} m_{B_d} (\hat{B}_{B_d} F_{B_d}^2) \eta_B m_W^2 S_0(x_t) |V_{td}|^2$ | V_{td} | from Δm_d

Time dependent flavor asymmetry :

$$\cos(\Delta m \Delta t) = \frac{N(B^0 \bar{B}^0) - N(B^0 \bar{B}^0)}{N(B^0 \bar{B}^0) + N(B^0 \bar{B}^0)}(\Delta t)$$

BABAR 80 fb⁻¹ : (l vs $D^* l\nu$)

$0.510 \pm 0.007 \pm 0.006$

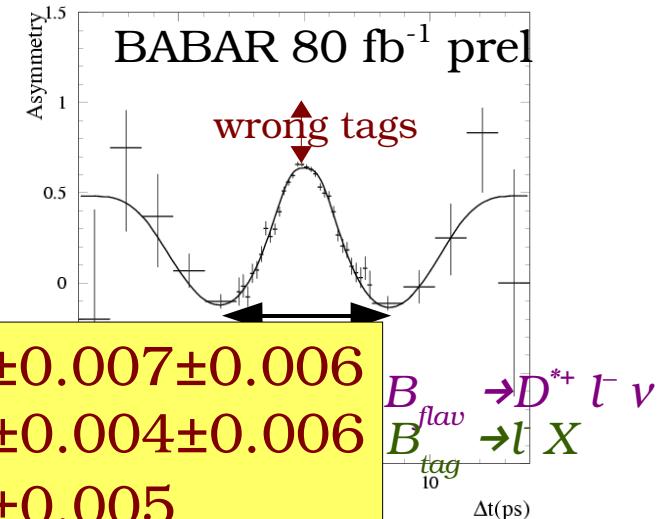

Belle 140 fb⁻¹ : (three analyses)

$0.509 \pm 0.004 \pm 0.006$

W.A. (8 exp., 31analyses)

0.506 ± 0.005

Best known parameter in B Physics

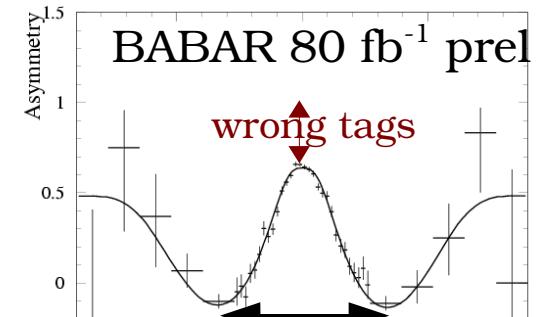

2:

$$\Delta m_d = \frac{G_F^2}{6\pi^2} m_{B_d} (\hat{B}_{B_d} F_{B_d}^2) \eta_B m_W^2 S_0(x_t) |V_{td}|^2$$

$|V_{td}|$ from Δm_d

Time dependent flavor asymmetry :

$$\cos(\Delta m \Delta t) = \frac{N(B^0 \bar{B}^0) - N(B^0 \bar{B}^0)}{N(B^0 \bar{B}^0) + N(B^0 \bar{B}^0)}(\Delta t)$$

BABAR 80 fb⁻¹ : (l vs $D^* l\nu$)

$0.510 \pm 0.007 \pm 0.006$

Belle 140 fb⁻¹ : (three analyses)

$0.509 \pm 0.004 \pm 0.006$

W.A. (8 exp., 31analyses)

0.506 ± 0.005

Best known parameter in B Physics

$B_{flav}^{tag} \rightarrow D^{*+} l^- \nu$
 $B_{flav}^{tag} \rightarrow l X$

... however ...

$$F_{B_d} \sqrt{B_{B_d}} = 0.192 \pm 0.026 \pm 0.09$$

→ Large error band in UT plane

2^a $\Delta m_d = \frac{G_F^2}{6\pi^2} m_{B_d} (\hat{B}_{B_d} F_{B_d}^2) \eta_B m_W^2 S_0(x_t) |V_{td}|^2$ $|V_{td}|$ from Δm_d

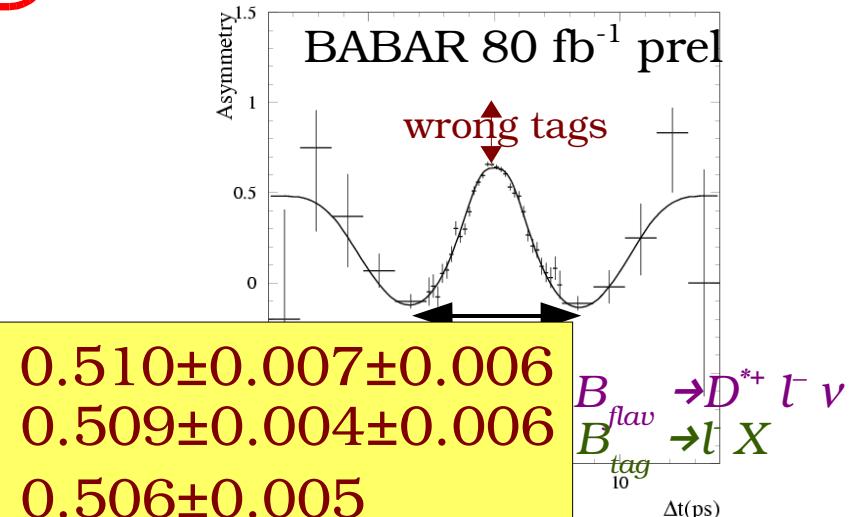

Time dependent flavor asymmetry :

$$\cos(\Delta m \Delta t) = \frac{N(B^0 \bar{B}^0) - N(B^0 \bar{B}^0)}{N(B^0 \bar{B}^0) + N(B^0 \bar{B}^0)} \Delta t$$

BABAR 80 fb⁻¹ : (l vs $D^* l \nu$)

Belle 140 fb⁻¹ : (three analyses)

W.A. (8 exp., 31analyses)

$0.510 \pm 0.007 \pm 0.006$

$0.509 \pm 0.004 \pm 0.006$

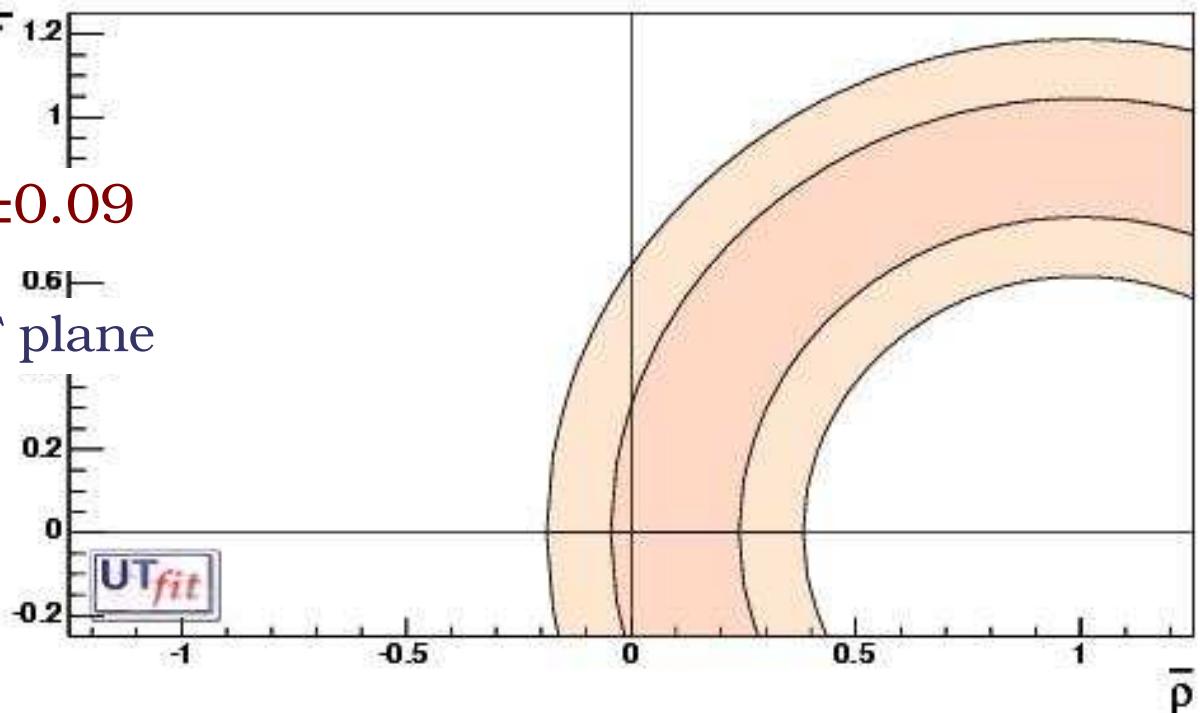

0.506 ± 0.005

Best known parameter in B Physics

... however ...

$$F_{Bd} \sqrt{B_{Bd}} = 0.192 \pm 0.026 \pm 0.09$$

→ Large error band in UT plane

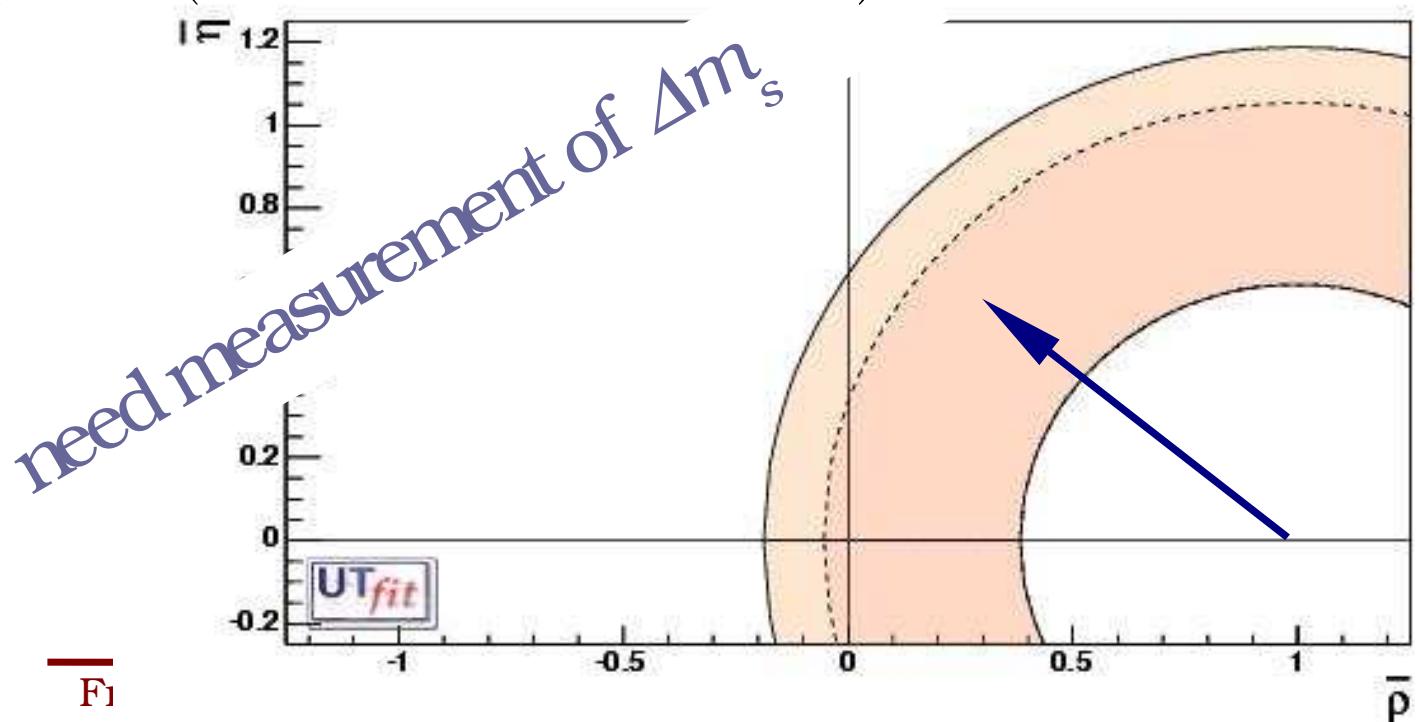

25

$|V_{td}|$ from $\Delta m_d / \Delta m_s$

$$\frac{\Delta m_d}{\Delta m_s} = \frac{m_{Bd}}{m_{Bs}} \frac{1}{\xi^2} \frac{|V_{td}|^2}{|V_{ts}|^2} \simeq \frac{m_{Bd}}{m_{Bs}} \frac{1}{\xi^2} \frac{|V_{td}|^2}{|V_{cb}|^2}$$

$$\xi = \frac{f_{Bs} \sqrt{B_{Bs}}}{f_{Bd} \sqrt{B_{Bd}}} = 1.24 \pm 0.06$$

$$\Delta m_s > 14.5 \text{ ps}^{-1} \quad (\text{LEP} + \text{SLD} + \text{Tevatron})$$

| V_{td} | from radiative penguins

$$\frac{|V_{td}|^2}{|V_{ts}|^2} \propto \frac{\Gamma(b \rightarrow d \gamma)}{\Gamma(b \rightarrow s \gamma)}$$

Theoretically clean. Exp. nightmare

$$\frac{\Gamma(B \rightarrow \rho/\omega \gamma)}{\Gamma(B \rightarrow K^* \gamma)}$$

Within exp. reach. Th. concerns:

{ Weak Annihilation
 SU(3) Breaking

$|V_{td}|$ from radiative penguins

$$\frac{|V_{td}|^2}{|V_{ts}|^2} \propto \frac{\Gamma(b \rightarrow d \gamma)}{\Gamma(b \rightarrow s \gamma)}$$

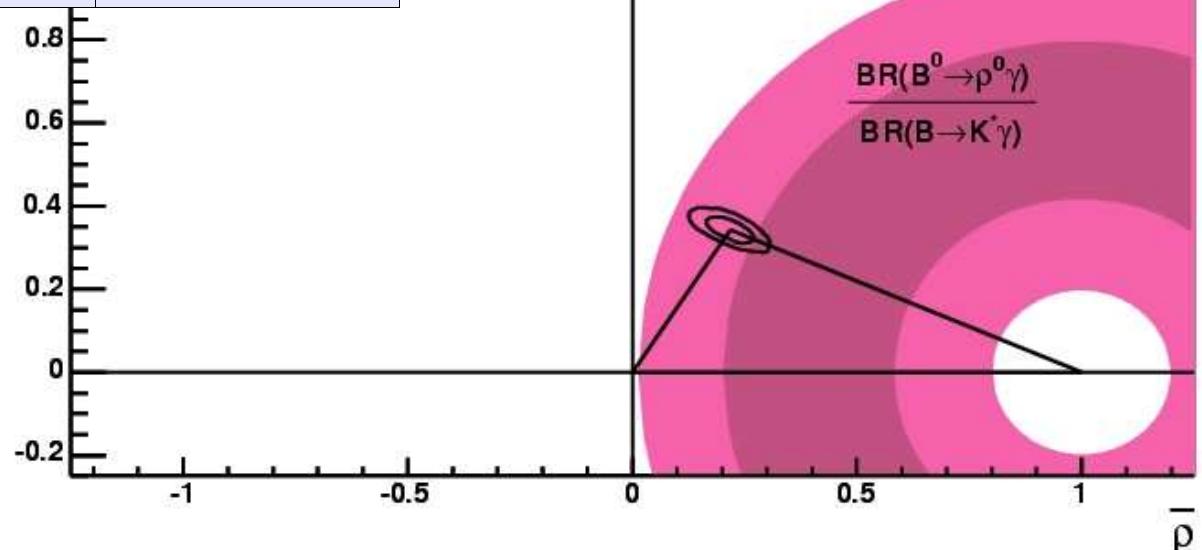

Theoretically clean. Exp. nightmare

$$\frac{\Gamma(B \rightarrow \rho/\omega \gamma)}{\Gamma(B \rightarrow K^* \gamma)}$$

Within exp. reach. Th. concerns:

{ Weak Annihilation
 SU(3) Breaking

	exp	BR (10^{-6})
$K^+ \gamma$	W.A.	40.1 ± 2.0
$K^0 \gamma$	W.A.	40.3 ± 2.6
$\rho / \omega \gamma$	BABAR (200 fb^{-1})	< 1.2
$\rho / \omega \gamma$	Belle (350 fb^{-1})	1.34 ± 0.36

$|V_{td}|$ from radiative penguins

$$\frac{|V_{td}|^2}{|V_{ts}|^2} \propto \frac{\Gamma(b \rightarrow d \gamma)}{\Gamma(b \rightarrow s \gamma)}$$

Theoretically clean. Exp. nightmare

$\rho / \omega \gamma$	Belle (350 fb^{-1})	1.34 ± 0.36

Not Yet Used in the CKM fit.
 Need to assess

- Theory issues
- Exp. consistency

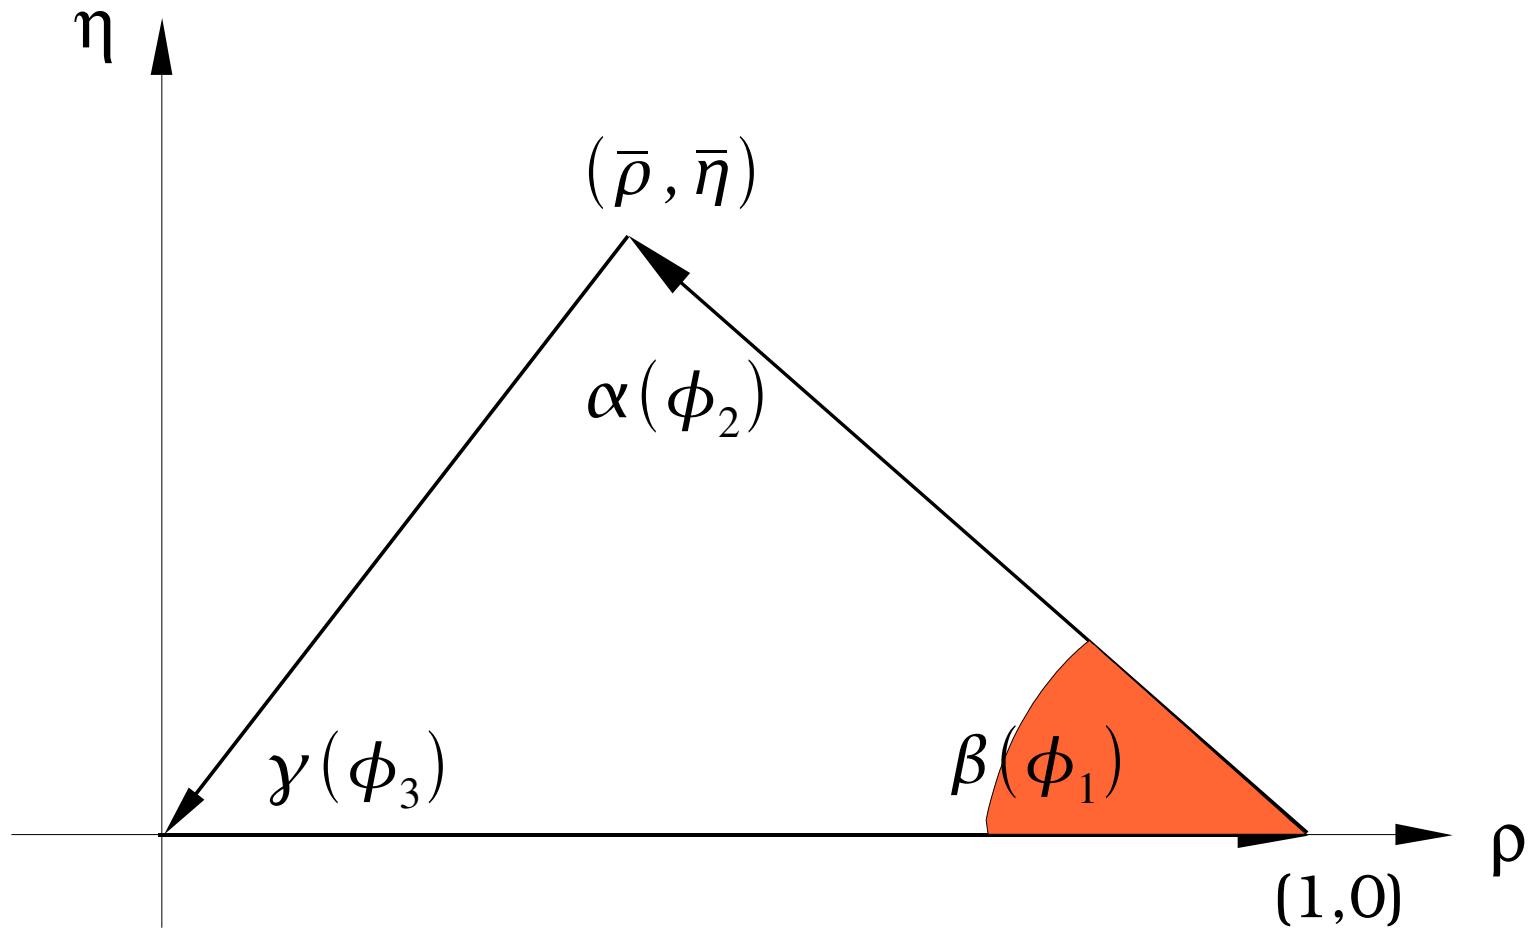

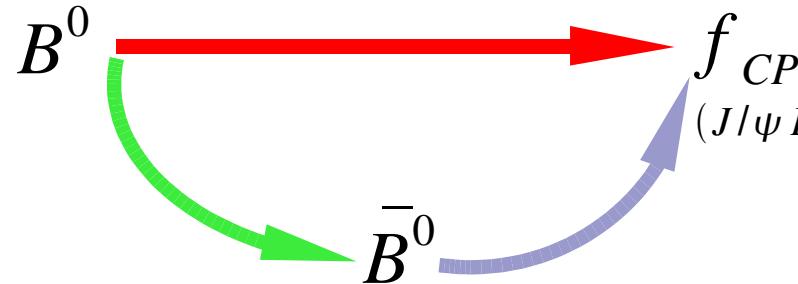

- Prediction from Sides only :
$$\sin(2\beta) = 0.794 \pm 0.032$$
- ... + ϵ_K (CP in K^0 system):
$$\sin(2\beta) = 0.793 \pm 0.032$$

TOPICS:

- ★ The Physics Program
- ★ The CKM Matrix and the Unitary Triangle
- ★ The Unitary Triangle by Sides
- ★ **The Unitary Triangle by Angles**
- ★ Search for N.P. & Constraints on the SM
- ★ The Unexpected
- ★ Conclusions & Perspectives

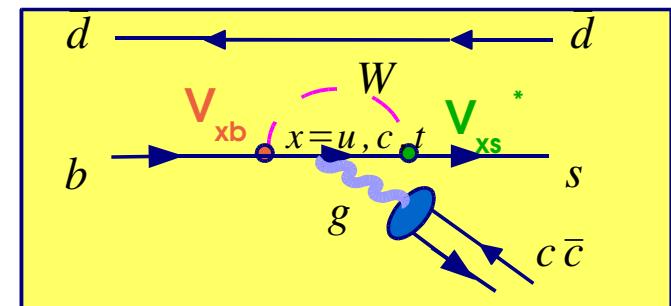

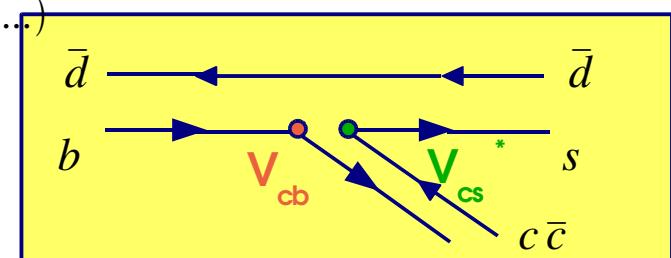

- Determined from interference of decays with and without mixing in $B^0 \rightarrow J/\psi K_{S/L}$

Th. clean:

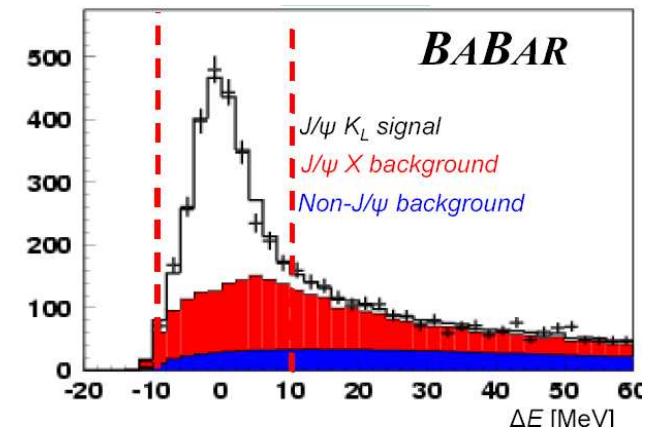

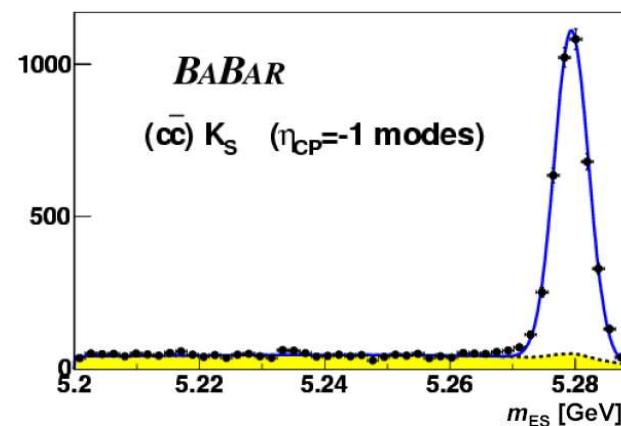

- Leading interfering penguin has same weak phase as tree
- Other weak phases suppressed by $o(\sin\Theta_c^2) \times o(\alpha_s) \sim 1\%$

$\sin 2\beta$ from $b \rightarrow c\bar{c}s$

Exp. clean:

- Large $B.R.$ $o(\%)$
- Mass-constraints : low background

Golden Mode

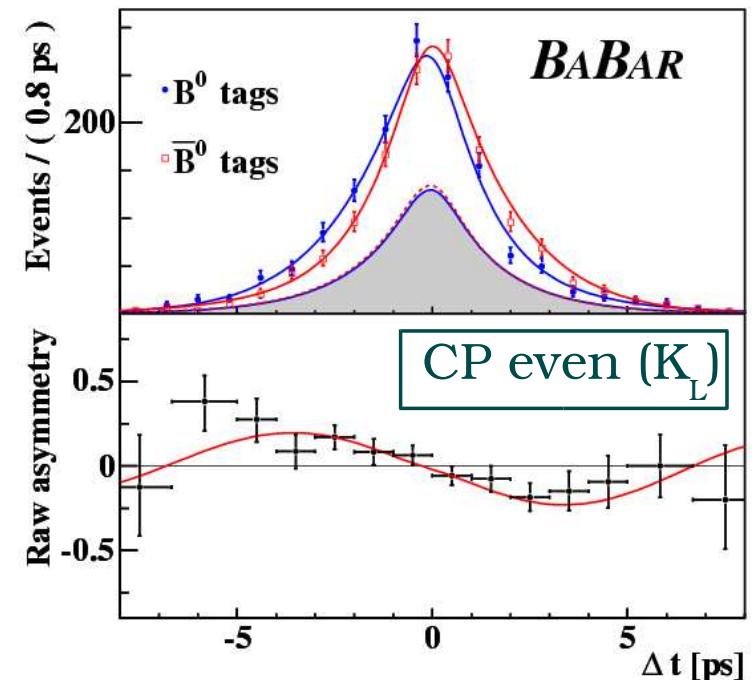

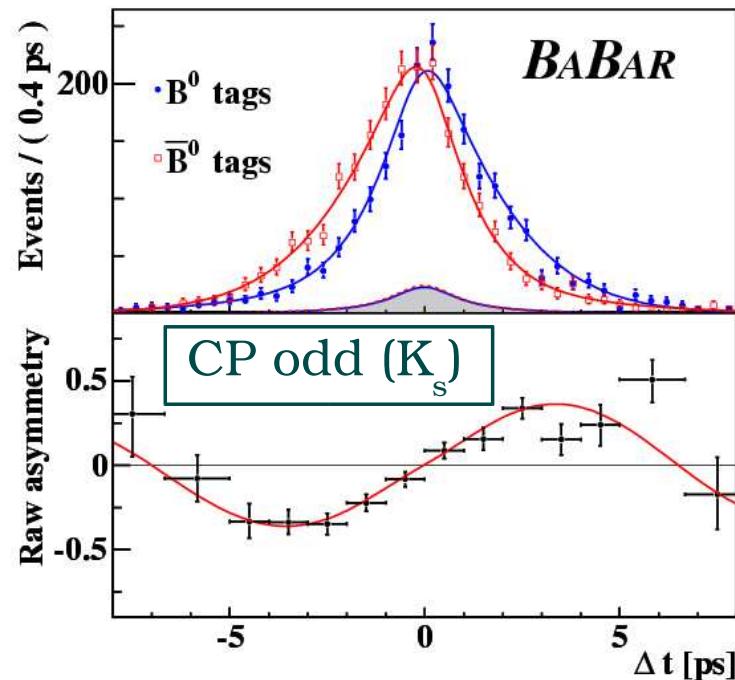

Time-dependent CP Asymmetry

$$A_{CP} = \frac{(B^0 \rightarrow f_{CP}) - (\bar{B}^0 \rightarrow f_{CP})}{(B^0 \rightarrow f_{CP}) + (\bar{B}^0 \rightarrow f_{CP})}(\Delta t) = \frac{\Im(\lambda)\sin(\Delta m \Delta t) + (1 - |\lambda|^2)\cos(\Delta m \Delta t)}{1 + |\lambda|^2}$$

$$\lambda = \frac{V_{tb} V_{td}^*}{V_{td} V_{tb}^*} \frac{V_{cb} V_{cd}^*}{V_{cd} V_{cb}^*} \frac{V_{cd} V_{cs}^*}{V_{cs} V_{cd}^*} = e^{-i2\beta}$$

B mixing
B decay
K⁰ mixing

- λ is a pure phase
- $Im(\lambda) = \sin(2\beta)$

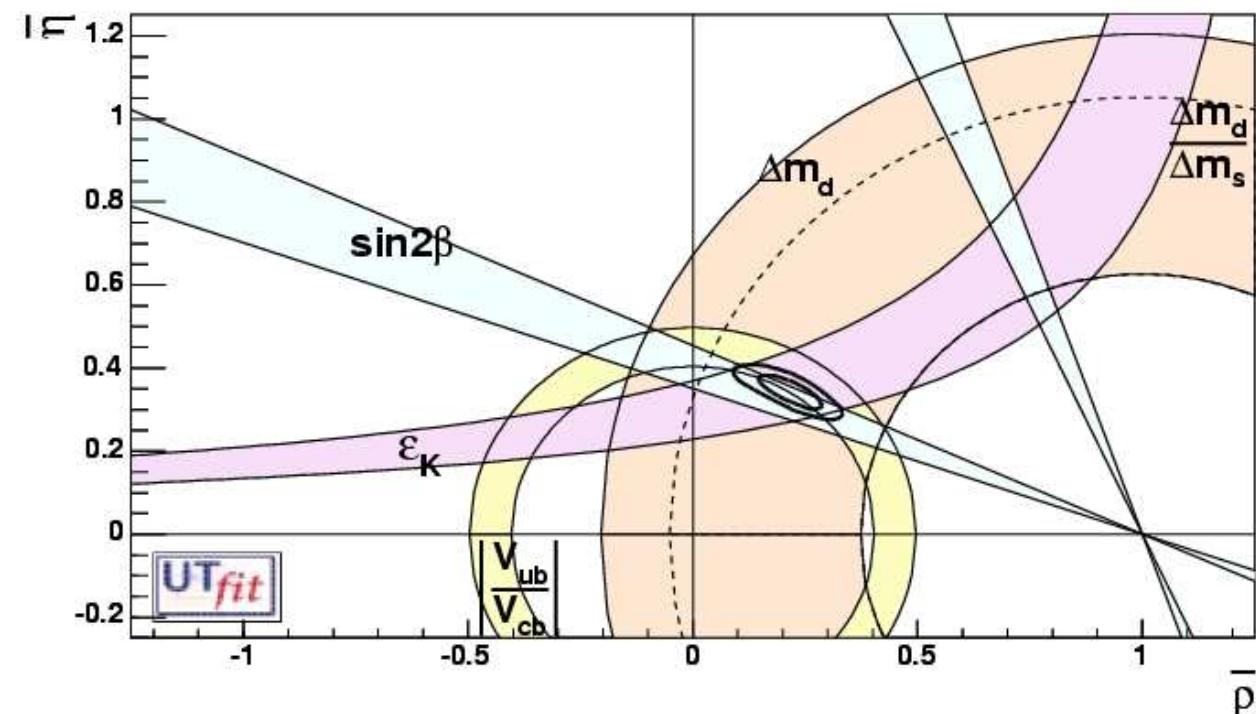

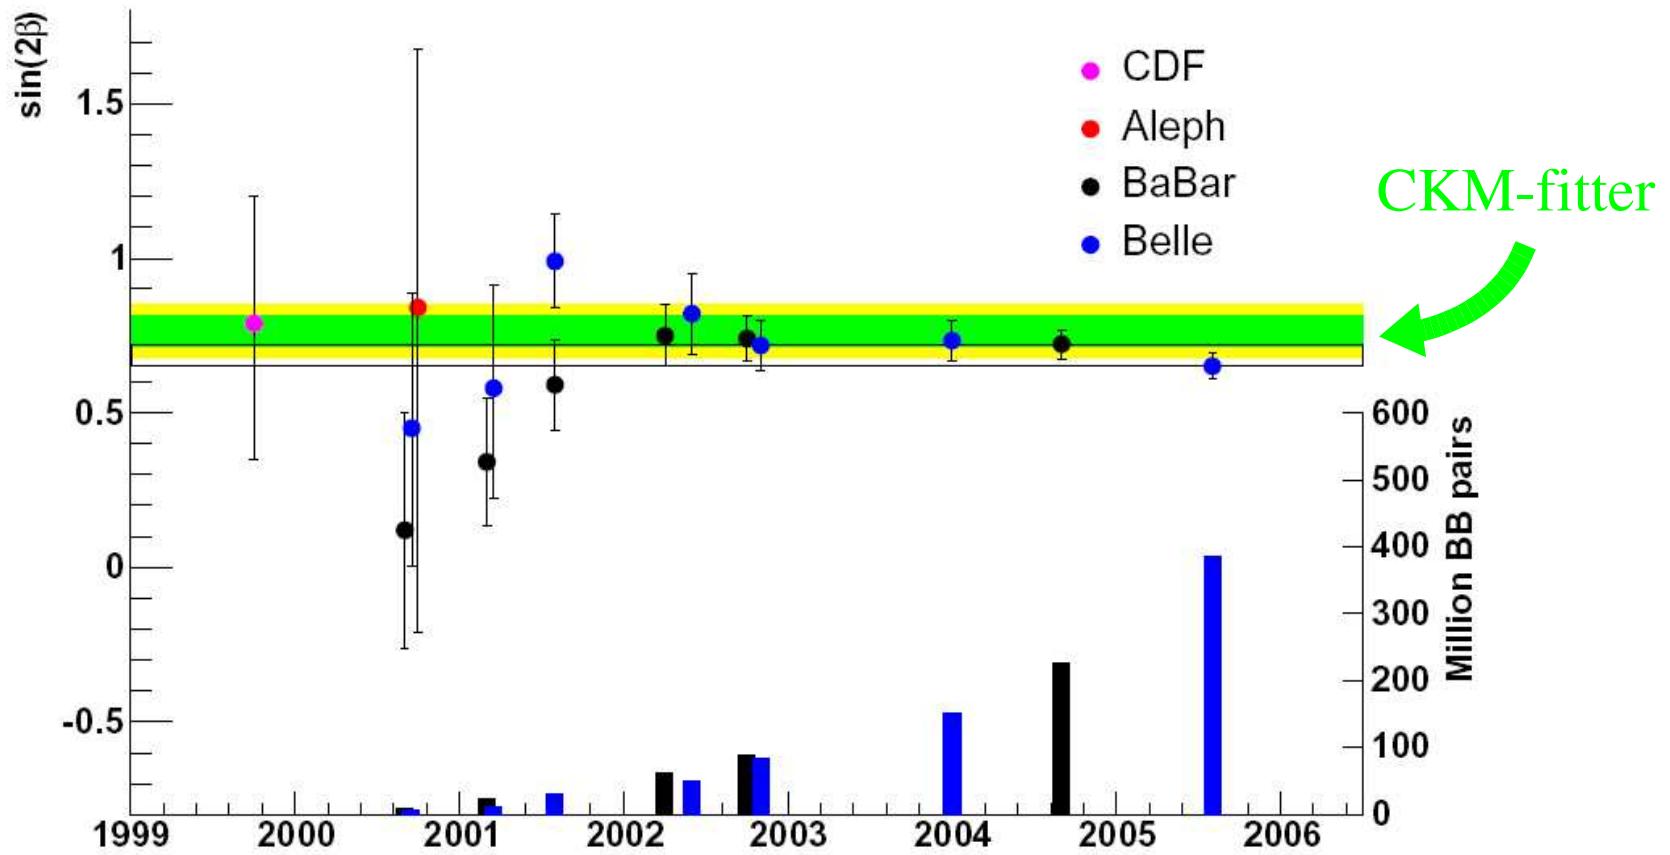

$\sin 2\beta$: results

<i>BABAR</i> (205 fb ⁻¹)	$0.722 \pm 0.040 \pm 0.023$
<i>Belle</i> (350 fb ⁻¹)	$0.652 \pm 0.039 \pm 0.020$
Average	$0.685 \pm 0.028 \pm 0.015$
UT-fit prediction sides + ϵ_K	0.793 ± 0.032
CKM-fitter pred. sides + ϵ_K + other angles	$0.742^{+0.072}_{-0.026}$

- ~ 2 σ wrt UT prediction

- ... interpretation is important !

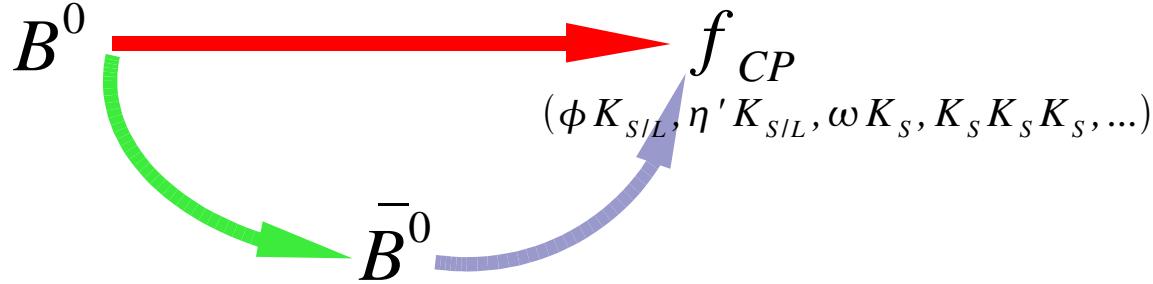

different interpretation of theoretical errors

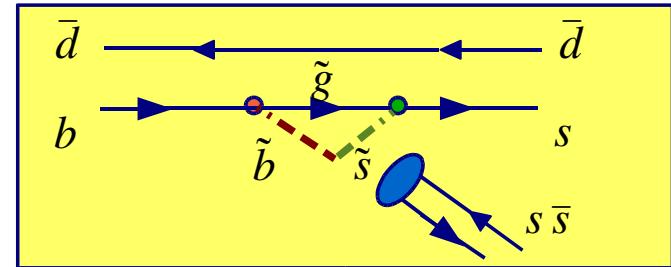

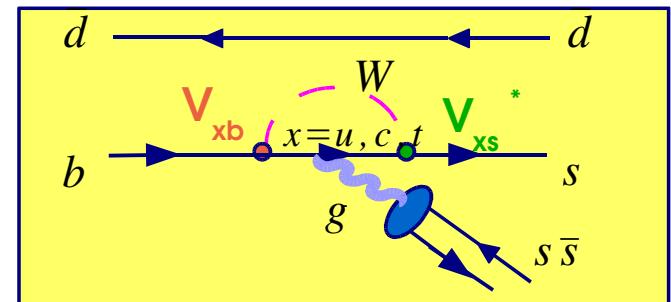

- BABAR ~ double statistics by June 2006
- Stay tuned

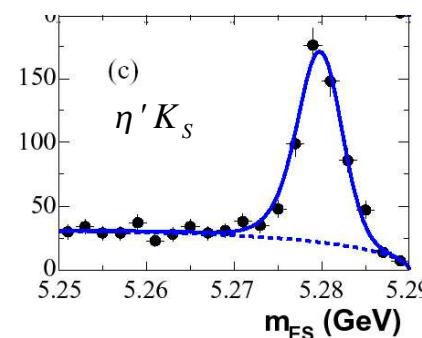

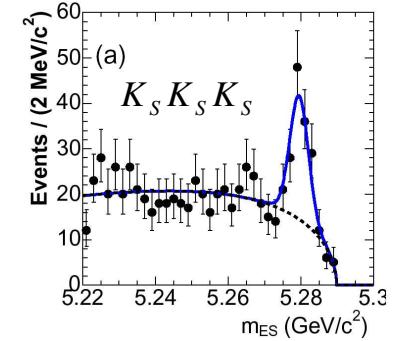

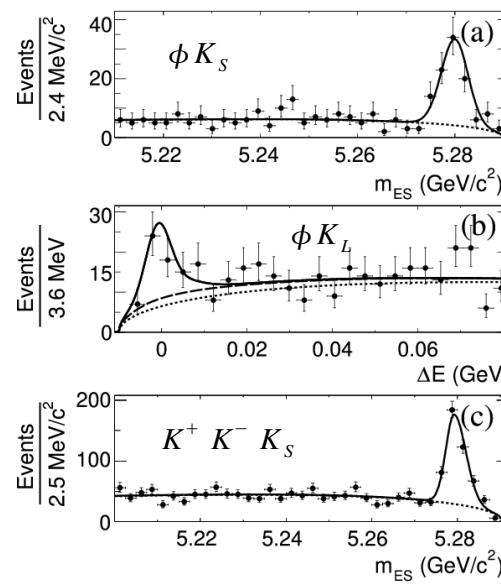

- No tree, penguin only
- Leading weak phase : β
- Other weak phases suppressed by $o(\sin\Theta_c^2) \sim 5\%$
- New phases from SuSy ?

$\sin 2\beta$ from $b \rightarrow sss$

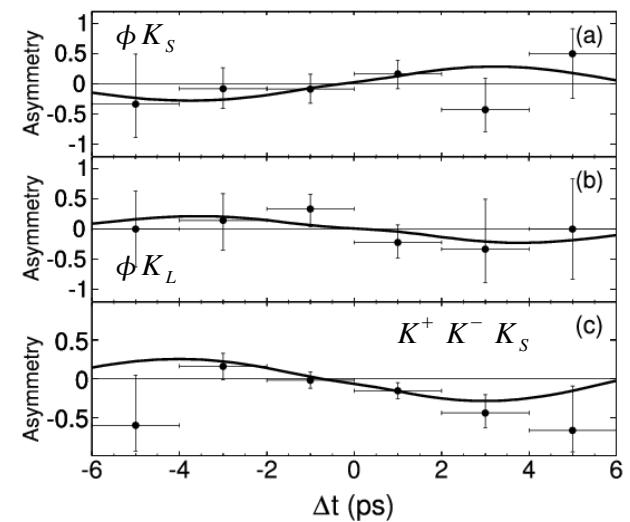

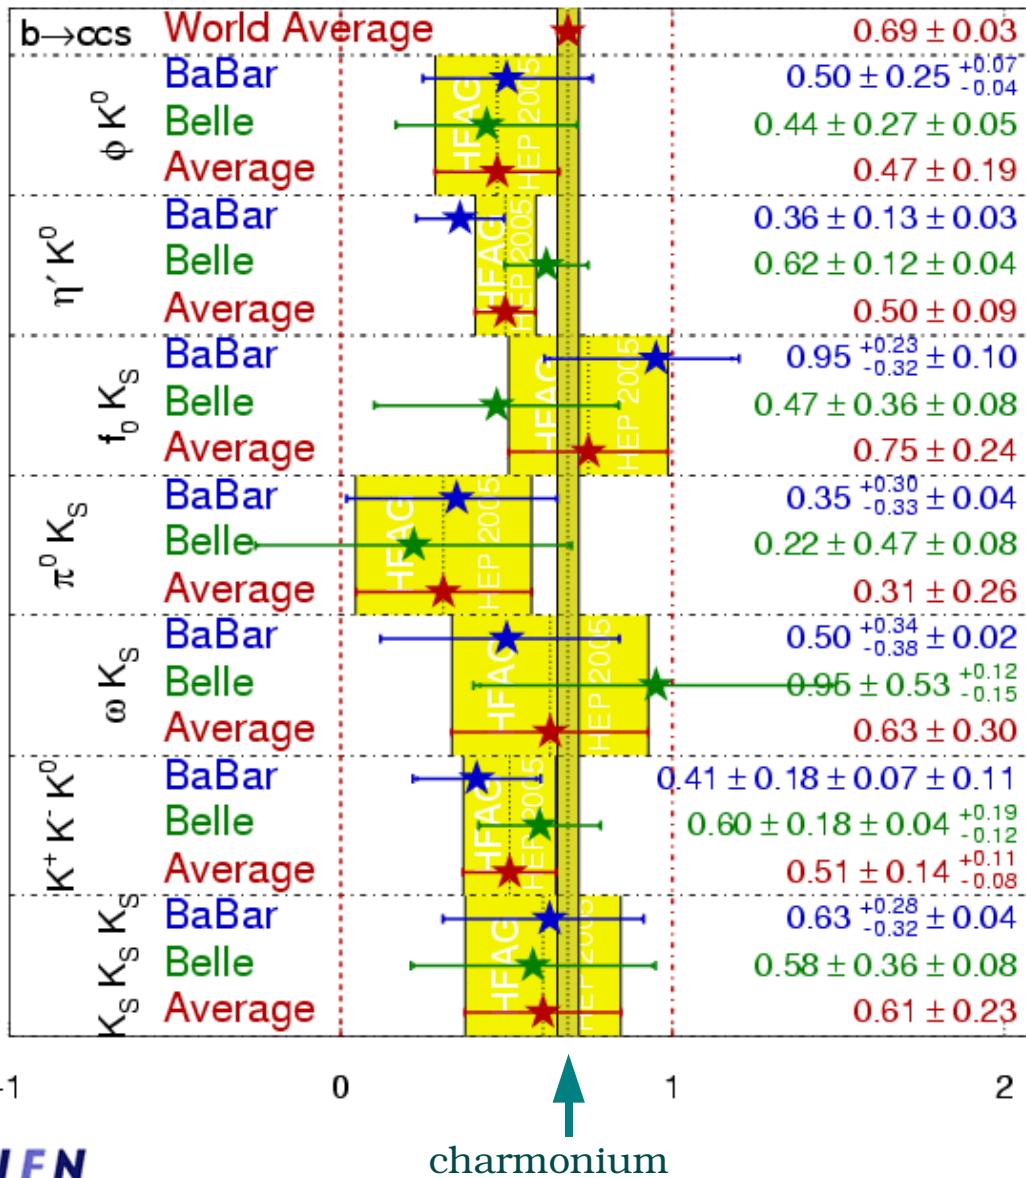

A test for New Physics

sin 2 β charmless vs charmonium

$$\sin(2\beta^{\text{eff}})/\sin(2\phi_1^{\text{eff}})$$

HFAG
HEP 2005
PRELIMINARY

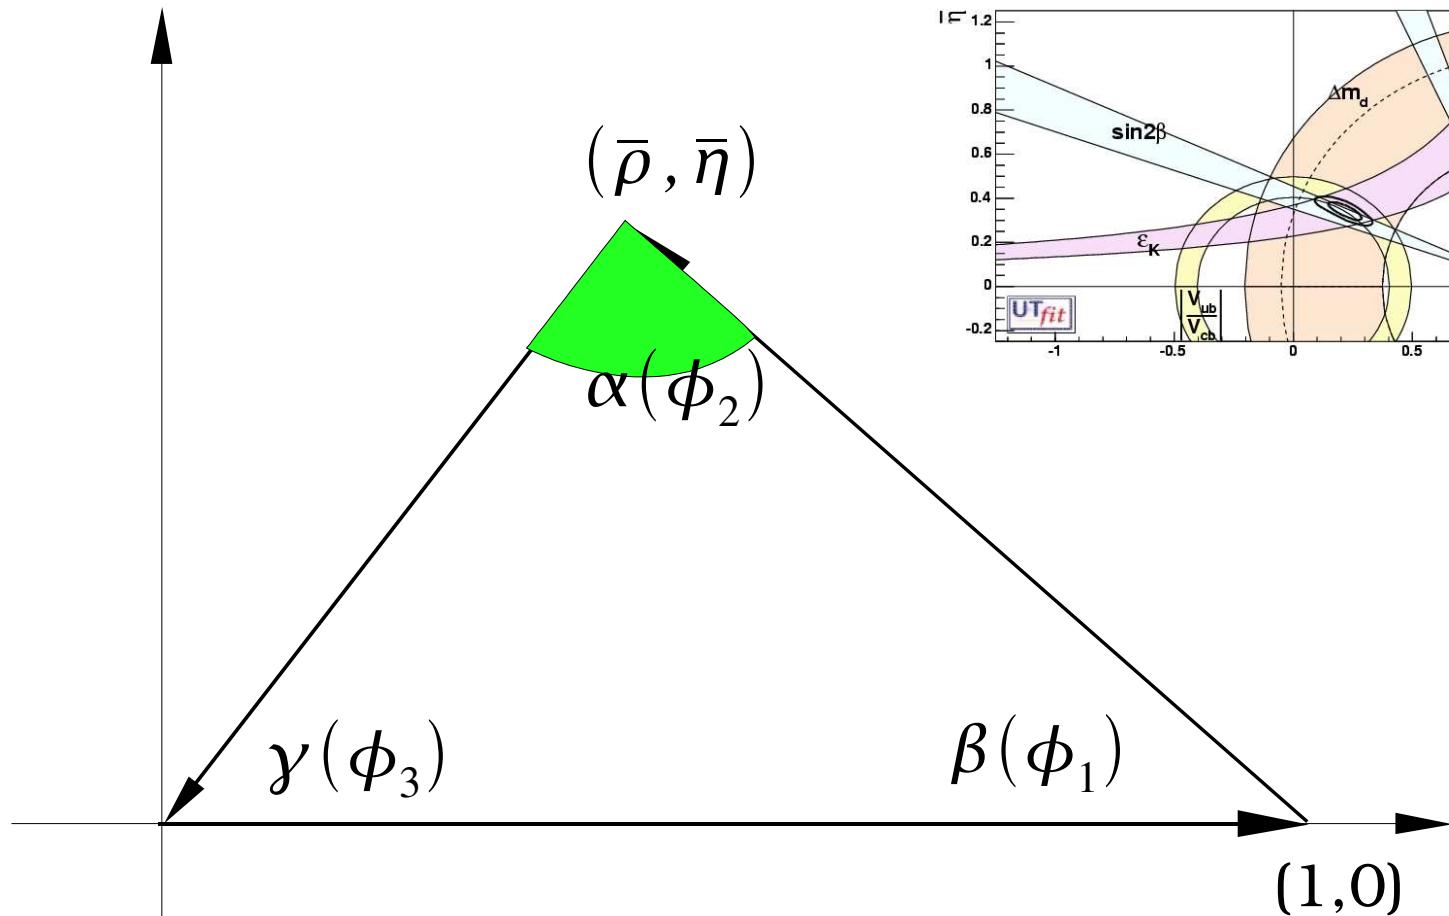

- No significant discrepancy 😊
- No hint of new Physics 😕

consistency improved also due to recent $\sin 2\beta$ measurement

do not average naively charmless results

UT angle-view: $\sin 2\alpha$

- sides + ϵ_K + $\sin 2\beta$:
- $$\alpha = (94.9 \pm 7.2)^\circ$$

sin2α from b→uud

- For pure tree transition:

$$\lambda = \frac{V_{td} V_{tb}^*}{V_{tb} V_{td}^*} \frac{V_{ub} V_{ud}^*}{V_{ud} V_{ub}^*} = e^{-i2\alpha}$$

- Penguin introduces new phase

$$\alpha \rightarrow \alpha_{eff} = \alpha + \kappa$$

- Penguin estimated from Isospin relations:

$$\begin{aligned} \frac{1}{\sqrt{2}} A^{+-} + A^{00} &= A^{+0} \\ \frac{1}{\sqrt{2}} A^{-+} + A^{\bar{0}0} &= A^{-0} \end{aligned}$$

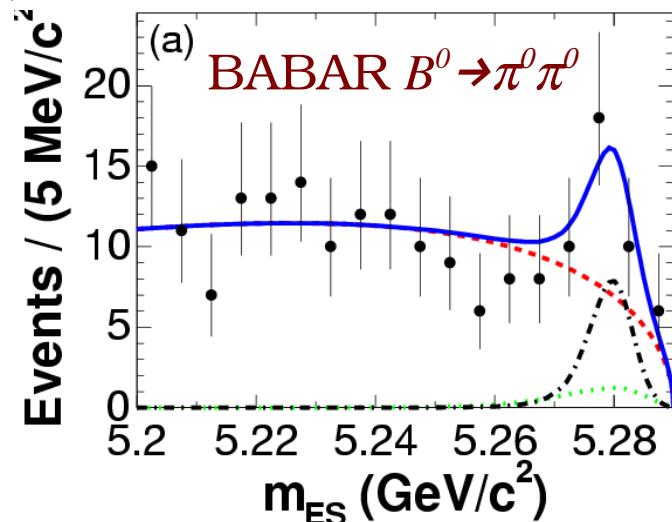

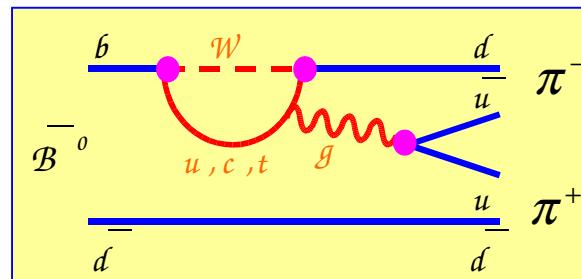

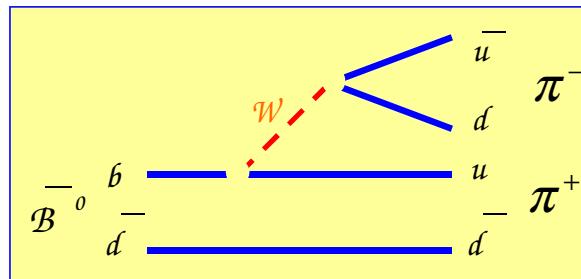

pure tree

$$A^{ij} = A(B \rightarrow \pi^i \pi^j)$$

- BABAR + Belle :

$$BR(B^0 \rightarrow \pi^0 \pi^0) = (1.45 \pm 0.29) 10^{-6}$$

- Sizable Penguin pollution in $B^0 \rightarrow \pi^+ \pi^-$

$B^0 \rightarrow \rho^0 \rho^0$:a Fortuitous Set of Beneficent Events

1. BABAR, PRL 94,131801 (2005)

$$BR(B^0 \rightarrow \rho^0 \rho^0) < 1.1 \times 10^{-6}$$

- ★ Small Penguin pollution in $B^0 \rightarrow \rho^+ \rho^-$
- ★ $|\alpha - \alpha_{eff}| < 11^\circ$

2. Angular analysis:

- ★ $\rho^+ \rho^-$ almost pure CP +

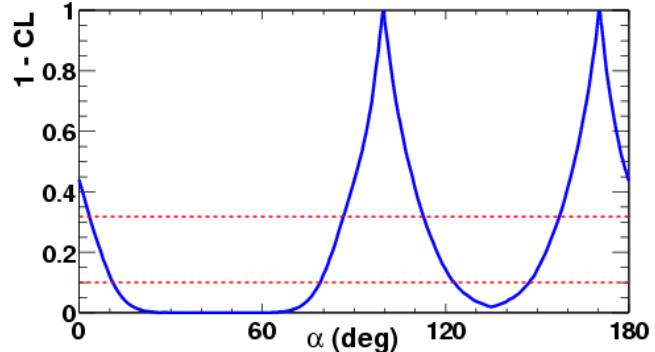

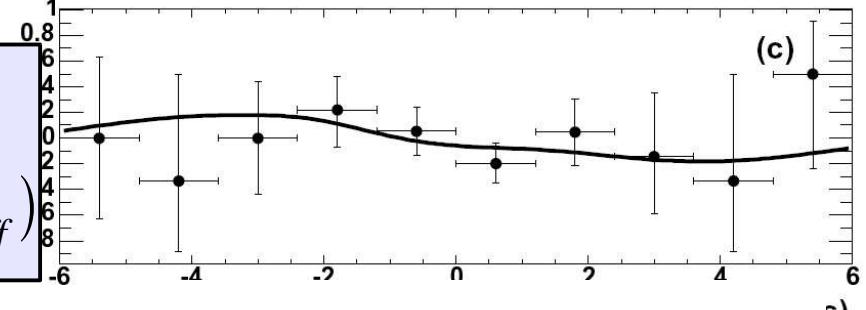

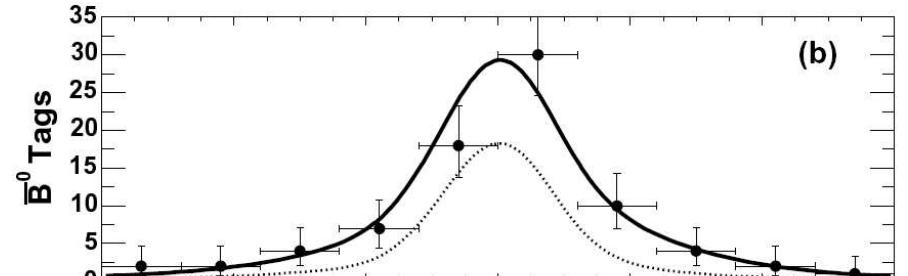

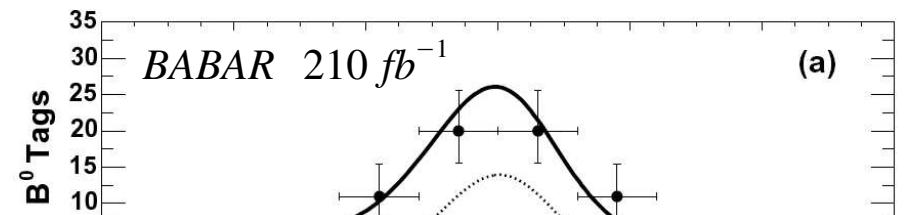

$$\Re(\lambda_{\rho\rho}) = -0.03 \pm 0.18 \pm 0.09$$

$$\Im(\lambda_{\rho\rho}) = -0.33 \pm 0.24^{+0.08}_{-0.14} \quad (= \sin 2\alpha_{eff})$$

$$\Im(\lambda_{\rho\rho}) = 0.09 \pm 0.42 \pm 0.08 \quad (Belle 350 fb^{-1})$$

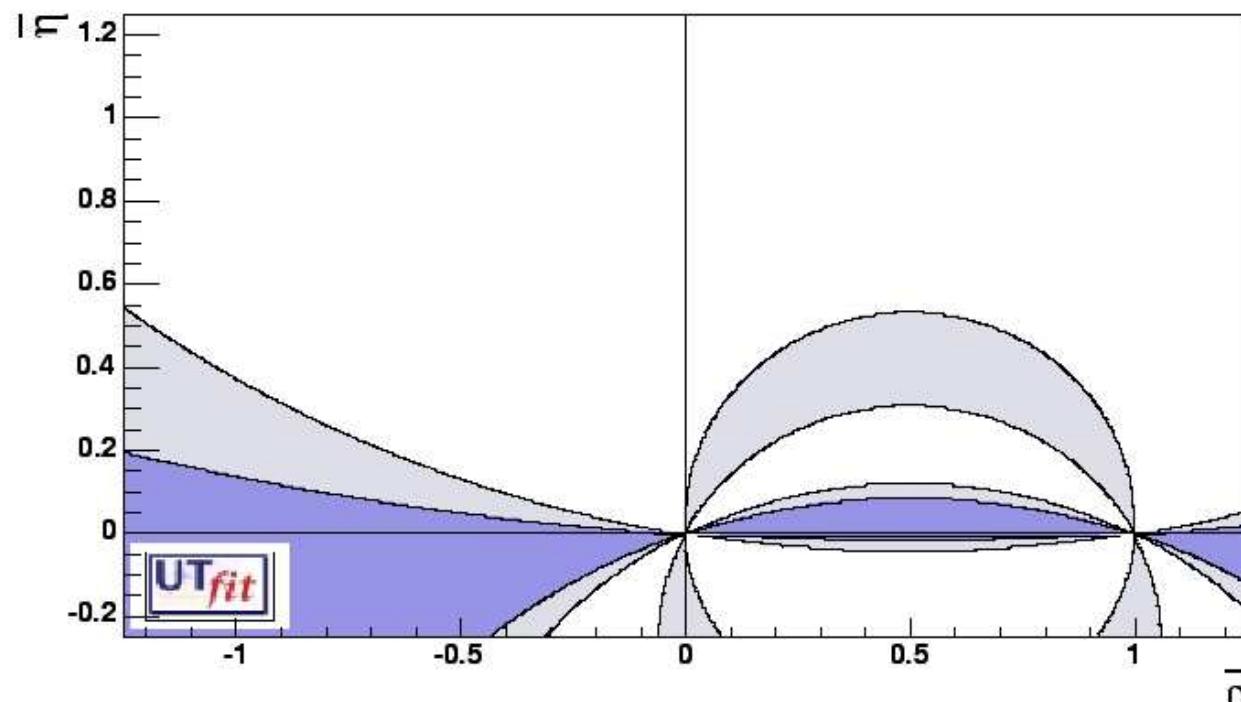

$\alpha = (100 \pm 13)^\circ$

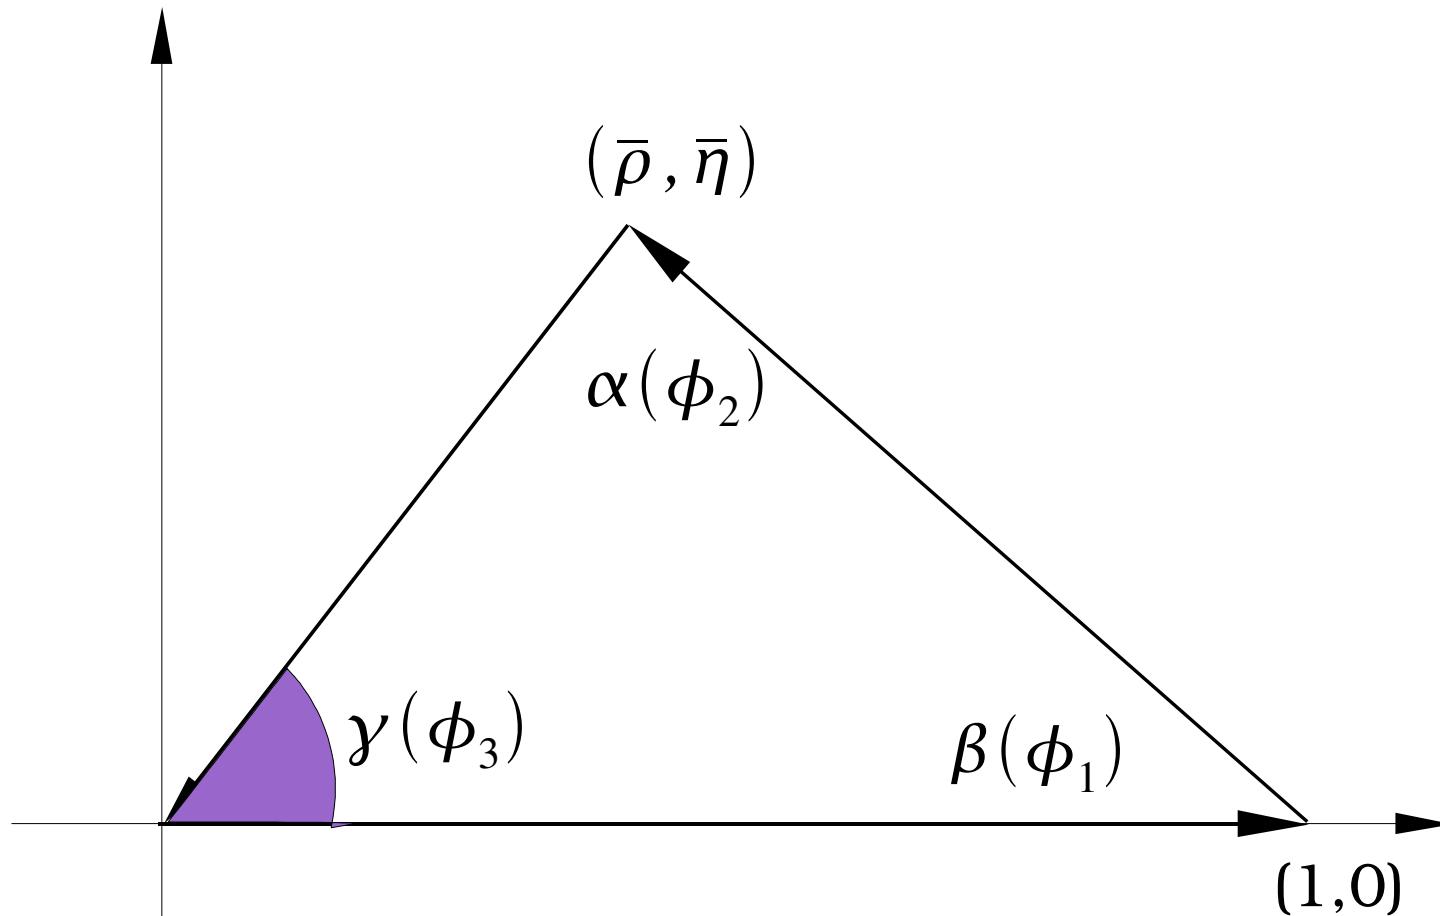

includes $\pm 11^\circ$ error from penguin estimation

- Adding constraints from $B \rightarrow \rho\pi$ Dalitz analysis, and neglecting mirror solutions:

α (meas.)	$(99^{+13}_{-8})^o$
<i>UT-fit prediction</i>	$(95 \pm 7)^o$

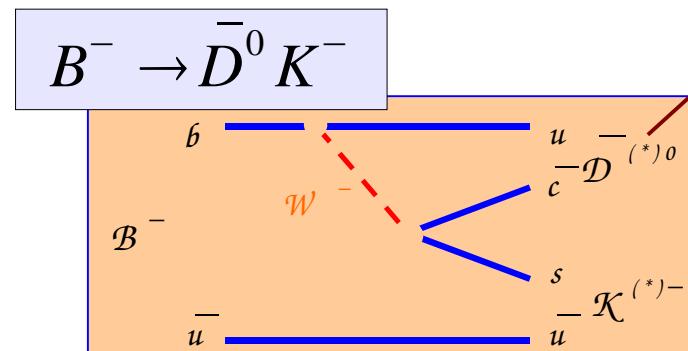

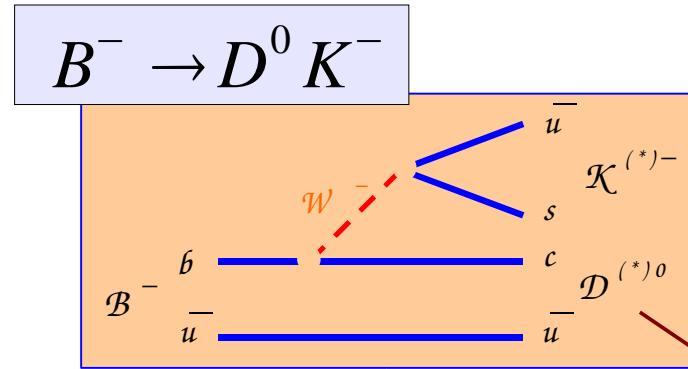

- Prediction from all other constraints:

$$\gamma = (57.6 \pm 5.7)^\circ$$

- BABAR Physics book (Oct 1998):
" Possibly the best tools to extract γ are time-dependent asymmetries
in B_s decays "
- .. a job for LHC-*b* ?

Exploit interference of pure tree transitions:

color suppressed

common final state

CP even/odd: $\pi\pi, KK, \pi\pi\pi,$
 $Atwood\ Dunietz\ Soni$
 $Cabibbo\ suppressed/favored : K^+ \pi^- ...$
 $K_s \pi^+ \pi^-$ (Dalitz)

$$\frac{A(B^- \rightarrow \bar{D}^0 K^-)}{A(B^- \rightarrow D^0 K^-)} = r_B e^{i\delta} e^{+iy}$$

$$\frac{A(B^+ \rightarrow \bar{D}^0 K^+)}{A(B^+ \rightarrow D^0 K^+)} = r_B e^{i\delta} e^{-iy}$$

strong phase (CP invariant)

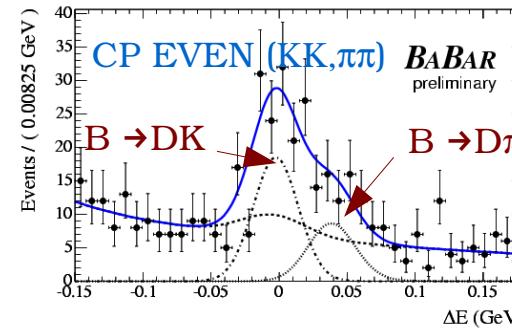

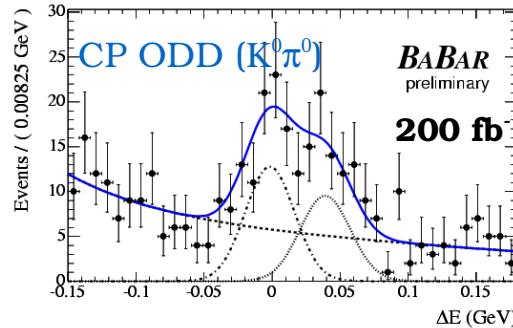

color suppression (~ 0.1)

- Compare rates for CP even and CP odd D^0 final states
- Four observables, three independent constraints: ☺

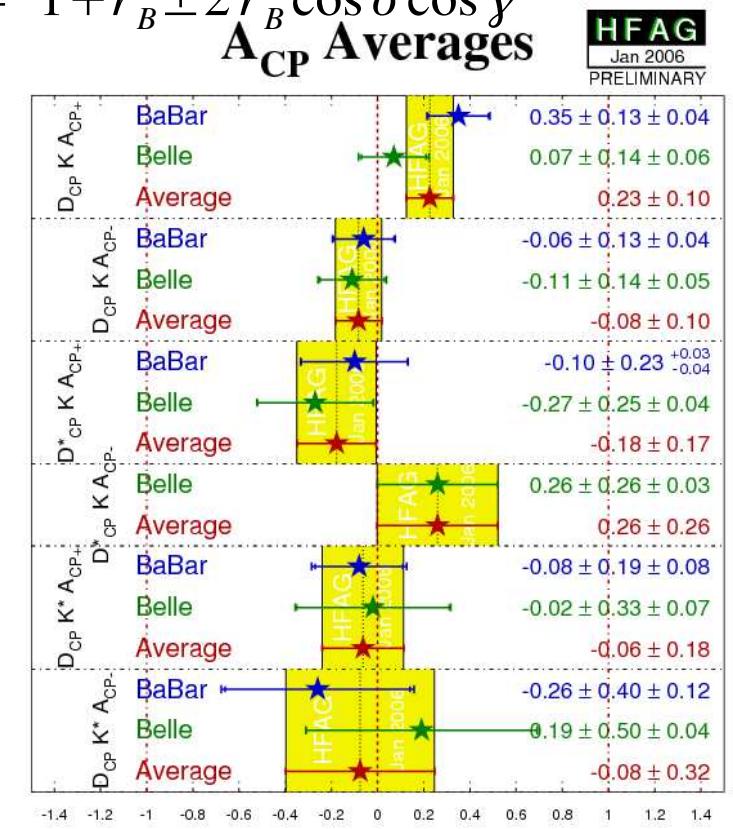

$$A_{CP\pm} = \frac{\Gamma(B^- \rightarrow D_{CP\pm} K^-) - \Gamma(B^+ \rightarrow D_{CP\pm} K^+)}{\Gamma(B^- \rightarrow D_{CP\pm} K^-) + \Gamma(B^+ \rightarrow D_{CP\pm} K^+)} = \frac{\pm 2 r_B \sin \delta \sin \gamma}{R_{CP}}$$

$$R_{CP\pm} = \frac{\Gamma(B^- \rightarrow D_{CP\pm} K^-) + \Gamma(B^+ \rightarrow D_{CP\pm} K^+)}{\Gamma(B^- \rightarrow D^0 K^-)} = 1 + r_B^2 \pm 2 r_B \cos \delta \cos \gamma$$

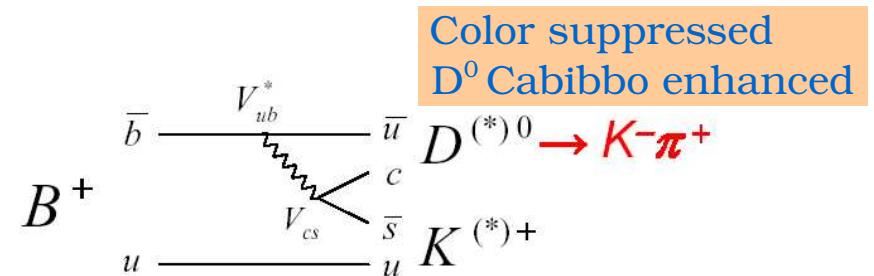

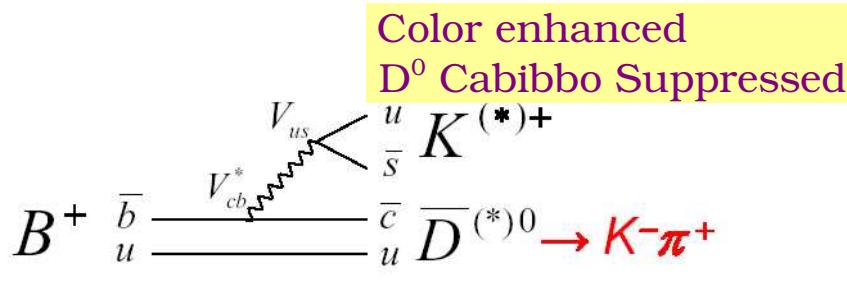

- Rates still too low ☹
- Small asymmetry ($r_B \sim 0.1$) ☹

- No significant bound on γ
- Job for super-B ?

- Exploit interference of Cabibbo favored and suppressed D^0 final states

- Expect sizable asymmetry 😊
- Only two constraints, low rates: 😞

$$R_{ADS} = \frac{\Gamma(B^- \rightarrow D_{ADS} K^{*-}) + \Gamma(B^+ \rightarrow D_{ADS} K^{*+})}{\Gamma(B^- \rightarrow D^0 K^{*-}) + \Gamma(B^+ \rightarrow D^0 K^{*+})} = r_B^2 + r_D^2 + 2r_B r_D \cos(\delta_B + \delta_D) \cos \gamma$$

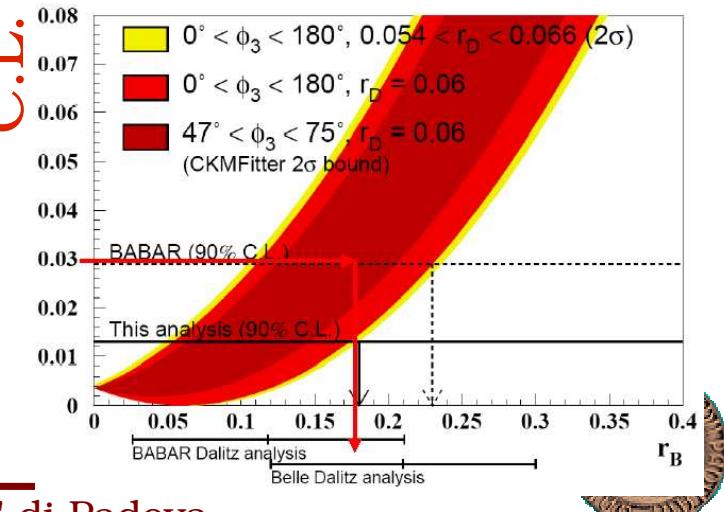

$$A_{ADS} = \frac{\Gamma(B^- \rightarrow D_{ADS} K^{*-}) - \Gamma(B^+ \rightarrow D_{ADS} K^{*+})}{\Gamma(B^- \rightarrow D_{ADS} K^{*-}) + \Gamma(B^+ \rightarrow D_{ADS} K^{*+})} = \frac{2r_B r_D \sin(\delta_B + \delta_D) \sin \gamma}{R_{ADS}}$$

- Limits on r_B (90%CL):

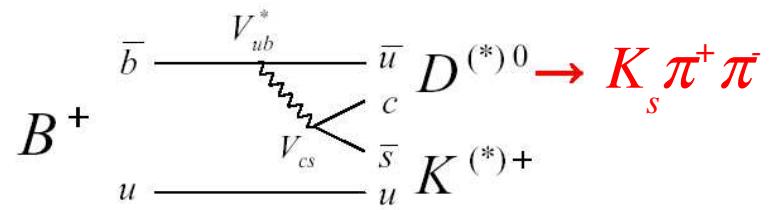

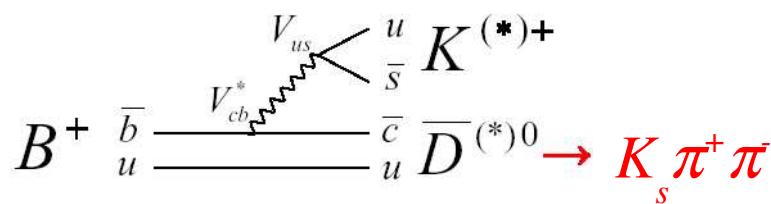

$r_B < 0.23$ BABAR $\sim 210 fb^{-1}$ (PRD 72,032004 (2005))

$r_B < 0.18$ Belle $350 fb^{-1}$

D⁰ Cabibbo suppression

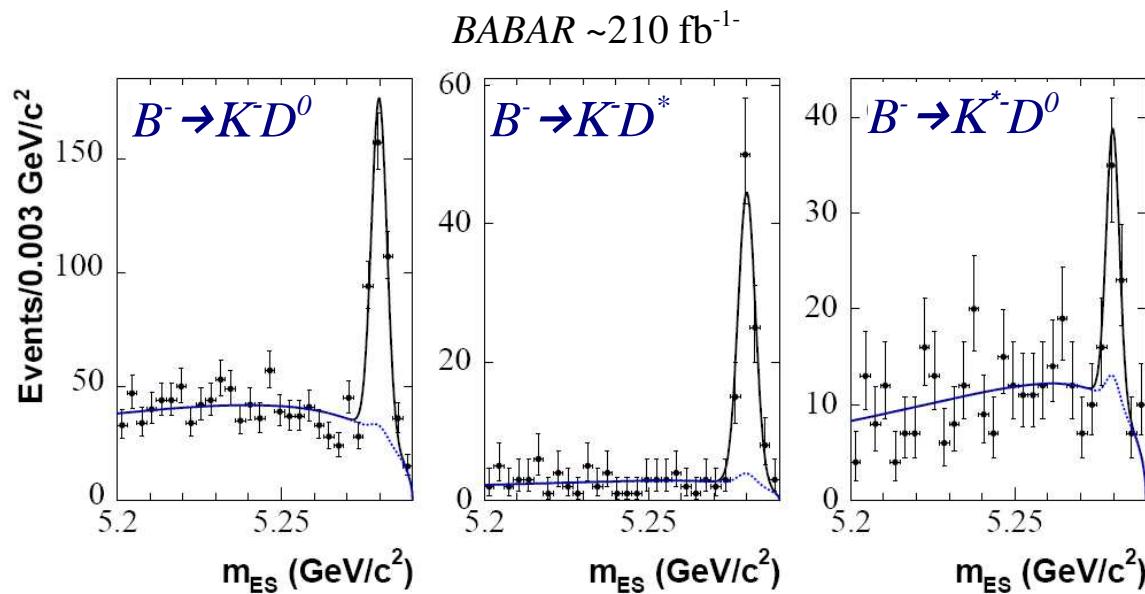

- Exploit differences in $(\bar{D}^0 \rightarrow K_s \pi^+ \pi^-)$ Dalitz plots

$$A(B^-) \propto f(m_-, m_+) + r_B e^{i(\delta - \gamma)} f(m_+, m_-)$$

$$A(B^+) \propto f(m_+, m_-) + r_B e^{i(\delta + \gamma)} f(m_-, m_+)$$

$m_{+/^-} = m(K_s \pi^{+/-})$

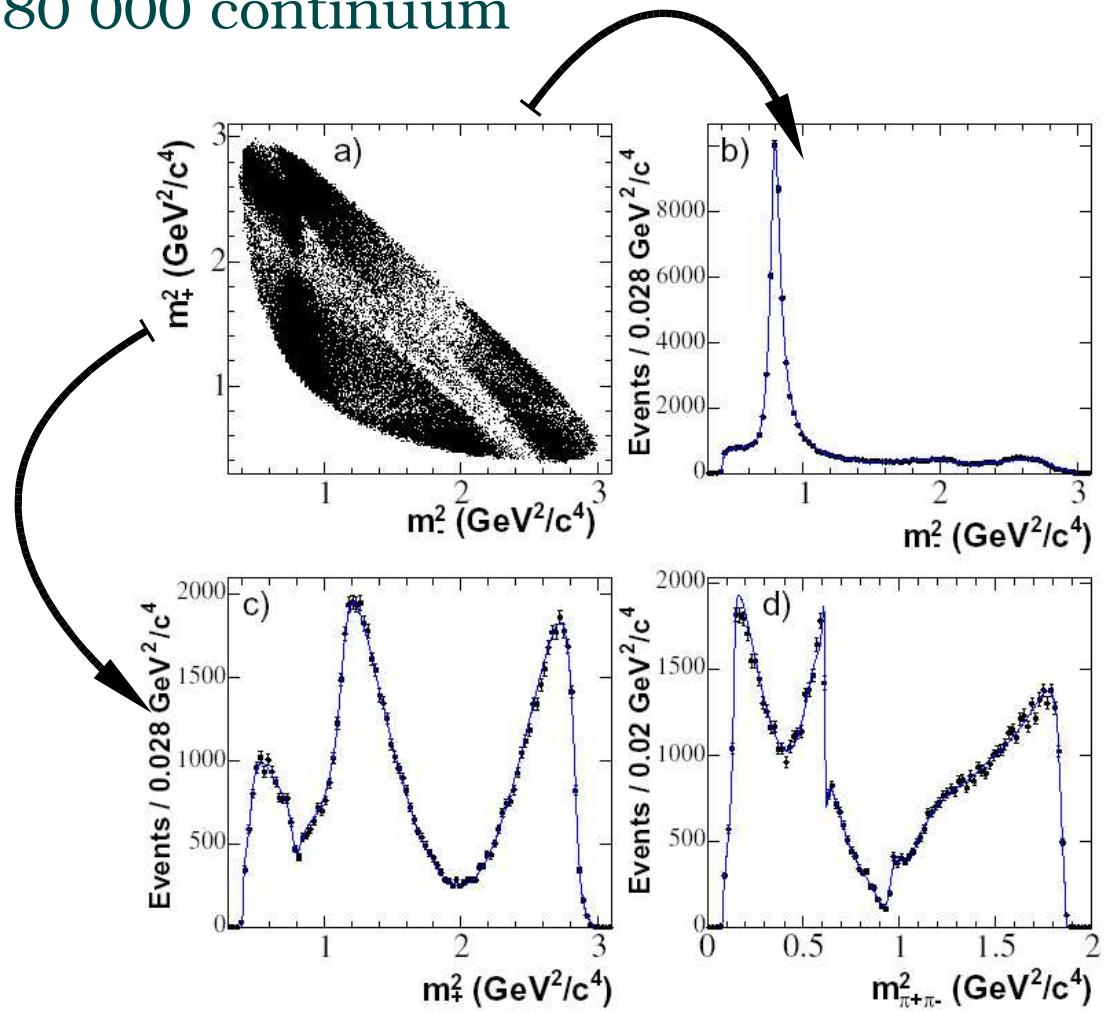

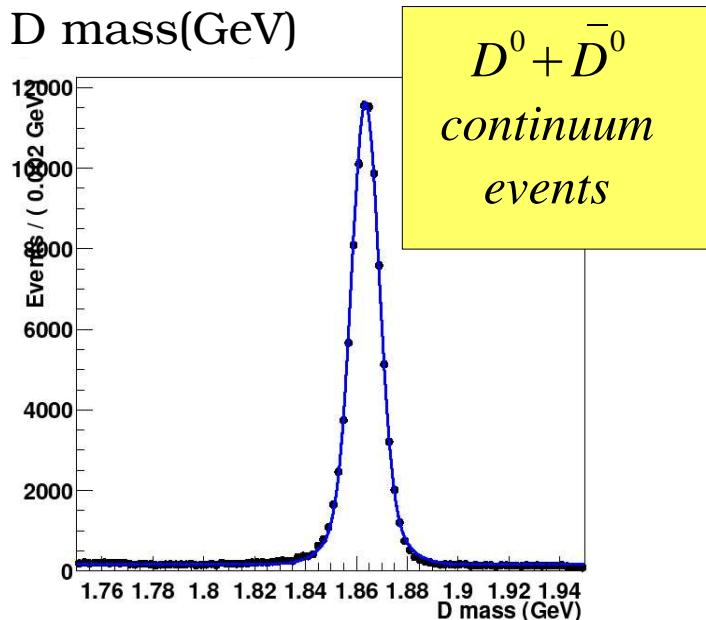

Pioneered by *Belle*

Franco Simonetto INFN & Universita' di Padova

- Fit $\Gamma(B^+)$, $\Gamma(B^-)$ in each point of the Dalitz plot
- Models for $f(m_{\pm}, m_{\mp})$ from $\sim 80\,000$ continuum decays:

$$D^{*\pm} \rightarrow \pi^{\pm} D^0$$

tags flavor

γ : Dalitz results

- *BABAR* ($\sim 210 \text{ fb}^{-1}$) :

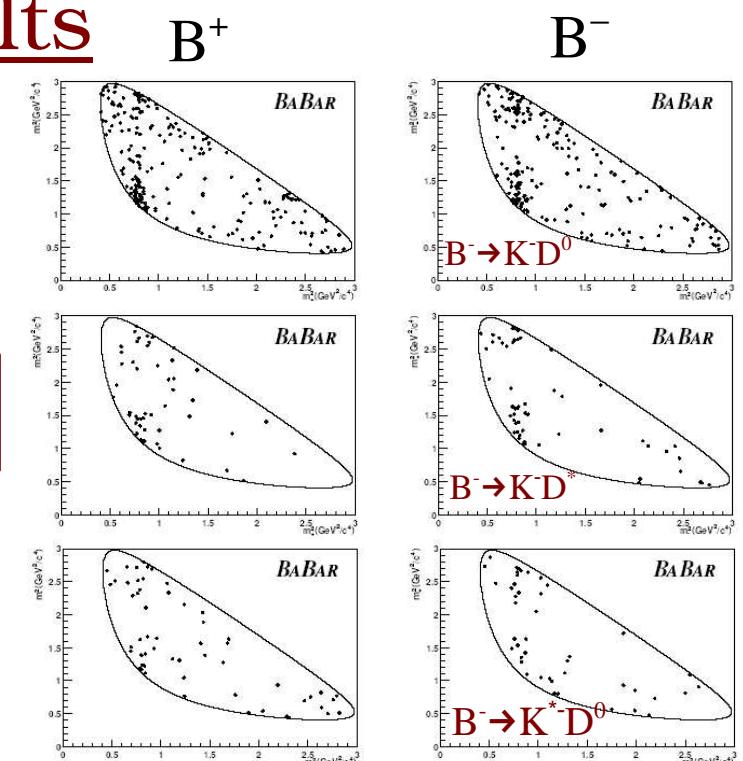

$$\begin{aligned} r_b &= 0.12 \pm 0.08 \pm 0.03 \pm 0.04 & \text{DK} \\ r_b^* &= 0.17 \pm 0.10 \pm 0.03 \pm 0.03 & D^*K \\ r_s &< 0.19 @ 90\% \text{ CL} & DK^* \end{aligned}$$

$$\gamma = (67 \pm 28_{\text{(stat)}} \pm 13_{\text{(syst.)}} \pm 11_{\text{(Dalitz Model)}})^\circ$$

- *Belle* ($\sim 350 \text{ fb}^{-1}$) :

$$\begin{aligned} r_b &= 0.21 \pm 0.08 \pm 0.03 \pm 0.04 & \text{DK} \\ r_b^* &= 0.12^{+0.16}_{-0.11} \pm 0.02 \pm 0.04 & D^*K \\ r_s &= 0.25^{+0.17}_{-0.18} \pm 0.09 \pm 0.04 \pm 0.08 & DK^* \end{aligned}$$

$$\gamma = (68 \pm 14_{\text{(stat)}} \pm 13_{\text{(syst.)}} \pm 11_{\text{(Dalitz Model)}})^\circ$$

γ : Dalitz results

- *BABAR* ($\sim 210 \text{ fb}^{-1}$) :

$$\begin{aligned} r_b &= 0.12 \pm 0.08 \pm 0.03 \pm 0.04 & \text{DK} \\ r_b^* &= 0.17 \pm 0.10 \pm 0.03 \pm 0.03 & D^*K \\ r_s &< 0.19 @ 90\% \text{ CL} & DK^* \end{aligned}$$

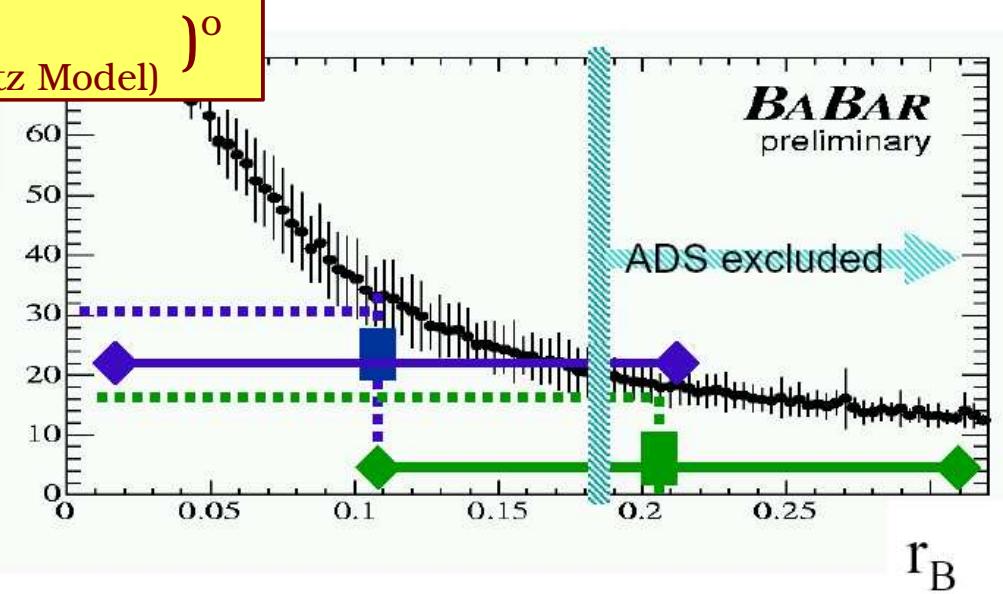

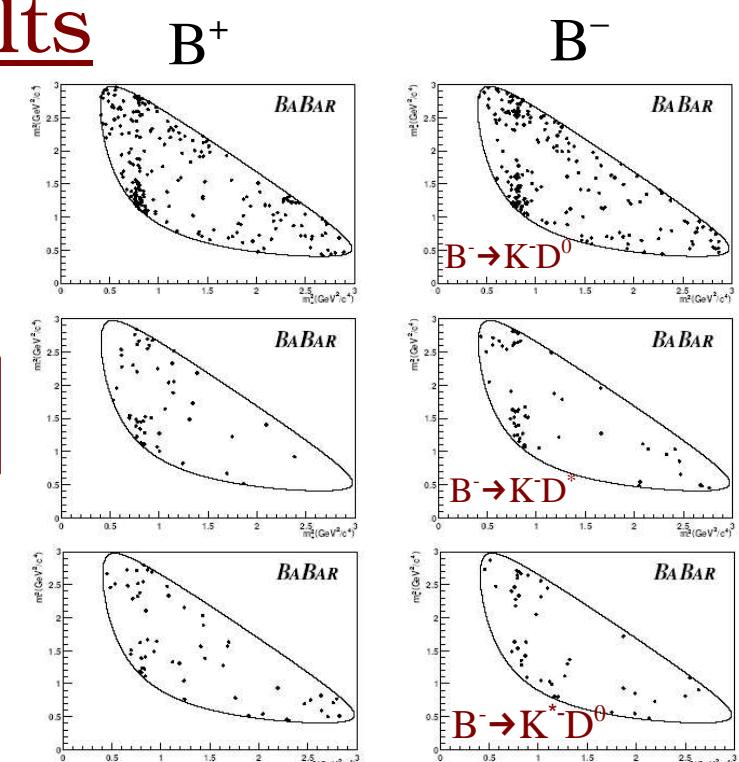

$$\gamma = (67 \pm 28_{(\text{stat})} \pm 13_{(\text{syst.})} \pm 11_{(\text{Dalitz Model})})^\circ$$

- *Belle* ($\sim 350 \text{ fb}^{-1}$) :

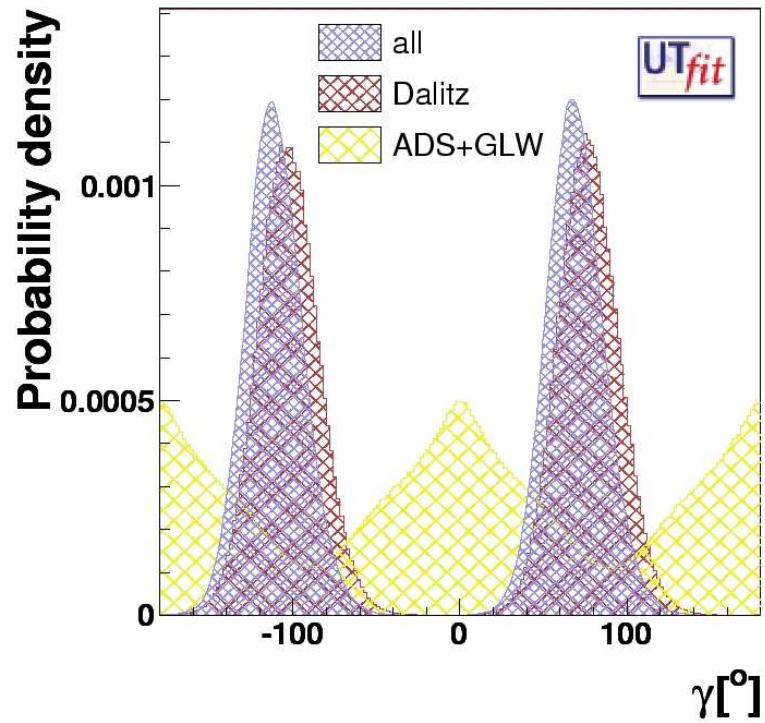

$$\begin{aligned} r_b &= 0.21 \pm 0.08 \pm 0.03 \pm 0.04 & \text{DK} \\ r_b^* &= 0.12^{+0.16}_{-0.11} \pm 0.02 \pm 0.04 & D^*K \\ r_s &= 0.25^{+0.17}_{-0.18} \pm 0.09 \pm 0.04 \pm 0.08 & DK^* \end{aligned}$$

$$\gamma = (68 \pm 14_{(\text{stat})} \pm 13_{(\text{syst.})} \pm 11_{(\text{Dalitz Model})})^\circ$$

- Luck factor: $\sigma(\gamma)$ depends on r_B
- *Belle* central r_B value excluded by *Belle* ADS analysis
 - More data needed !

- Dalitz method: first direct measurement of γ !
- Limits on r_B from ADS,DGW help improve allowed bounds
- Of main importance to determine the actual value of r_B

γ (meas.)	$(68 \pm 17)^\circ$
<i>UT-fit prediction</i>	$(58 \pm 6)^\circ$

Summary on CKM Constraints

- B-factories operations allow to constrain the UT from different point of views:

The Angles

	$\bar{\rho}$	$\bar{\eta}$
sides	0.218 ± 0.043	0.385 ± 0.028
angles	0.187 ± 0.052	0.322 ± 0.025

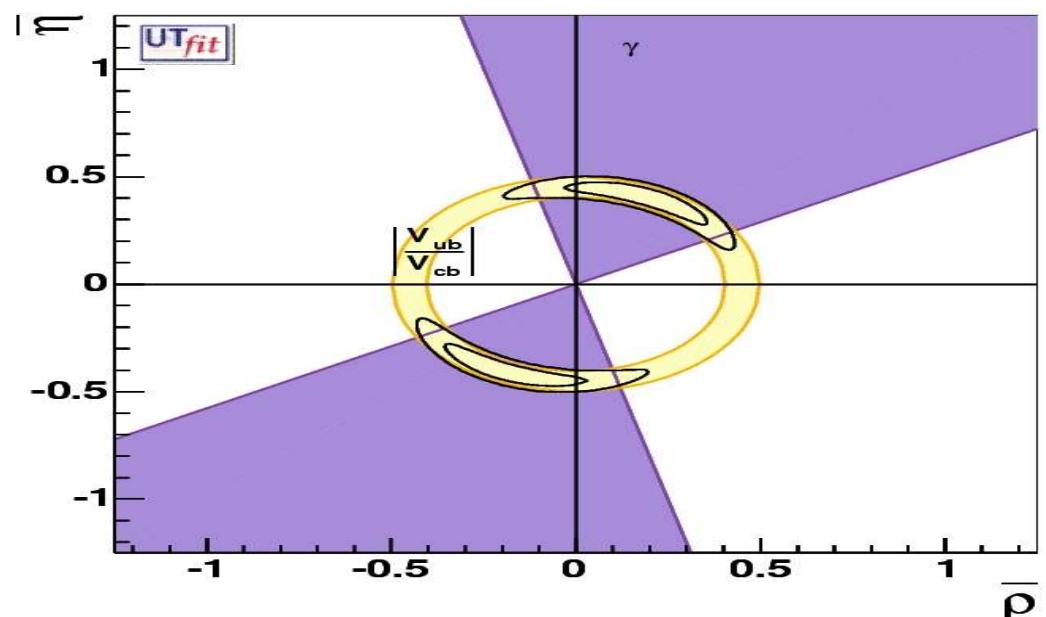

$$\bar{\rho} = 0.187 \pm 0.052 \quad \bar{\eta} = 0.322 \pm 0.025$$

Summary on CKM Constraints

- B-factories operations allow to constrain the UT from different point of views:

Tree Only

	$\bar{\rho}$	$\bar{\eta}$
sides	0.218 ± 0.043	0.385 ± 0.028
angles	0.187 ± 0.052	0.322 ± 0.025
tree	0.18 ± 0.12	0.41 ± 0.05

$$\bar{\rho} = 0.18 \pm 0.12$$

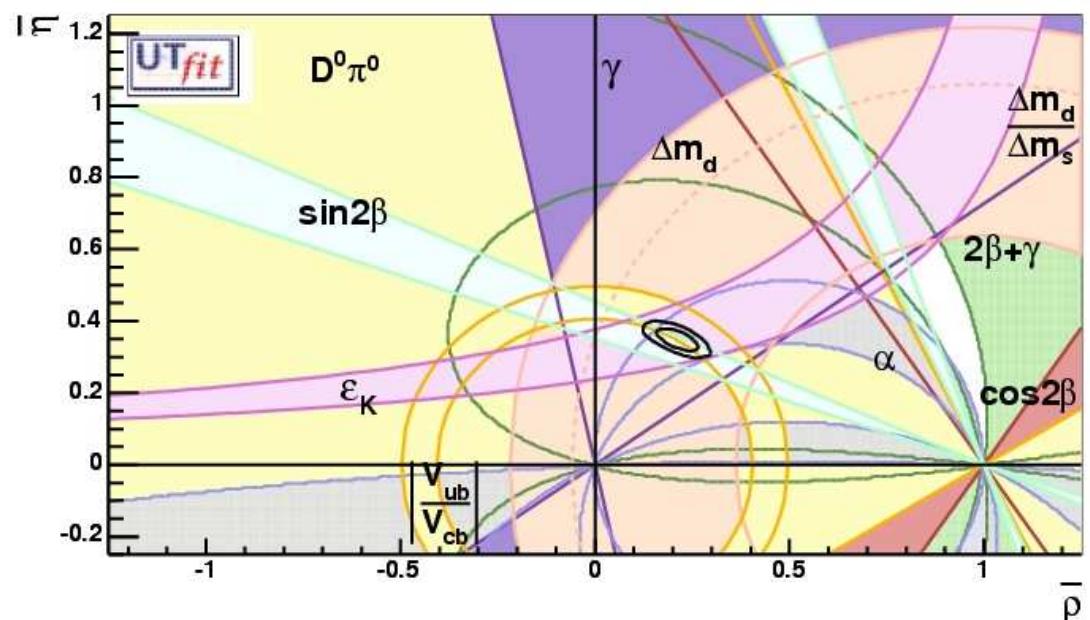

$$\bar{\eta} = 0.41 \pm 0.05$$

Conclusion on CKM Constraints

- The S.M. picture of CP is at date perfectly consistent 😊
- No hint of New Physics from the UT 😞

All the processes

	$\bar{\rho}$	$\bar{\eta}$
sides	0.218 ± 0.043	0.385 ± 0.028
angles	0.187 ± 0.052	0.322 ± 0.025
tree	0.18 ± 0.12	0.41 ± 0.05
all	0.210 ± 0.036	0.347 ± 0.021

$$\bar{\rho} = 0.210 \pm 0.036 \quad \bar{\eta} = 0.347 \pm 0.021$$

- The Paradigm:

Search for New Physics contributions to processes
with low expected yield in the Standard Model :

$$B^+ \rightarrow \tau^+ \nu$$

$$B^- \rightarrow s \gamma$$

$$\tau^- \rightarrow \mu \gamma, e \gamma, l l l, \dots$$

A Tree Process: $B^+ \rightarrow \tau^+ \nu_\tau$

$$\mathcal{B}(B^+ \rightarrow \tau^+ \nu_\tau) = \frac{G_F^2 m_B}{8\pi} m_\tau^2 \left(1 - \frac{m_\tau^2}{m_B^2}\right)^2 f_B^2 |V_{ub}|^2 \tau_B = (1.0 \pm 0.5) 10^{-4} \text{ UT-fit}$$

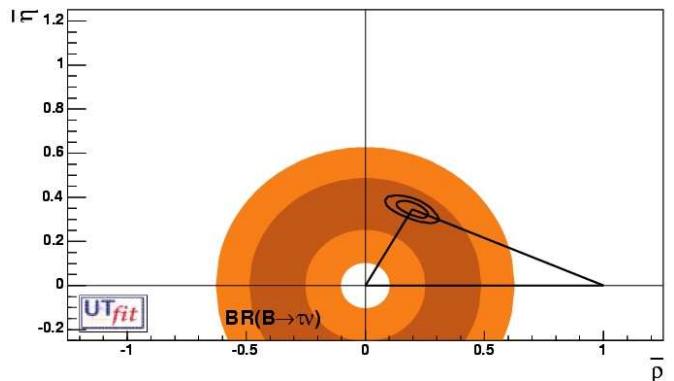

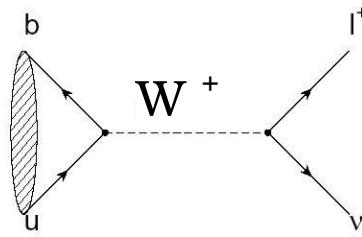

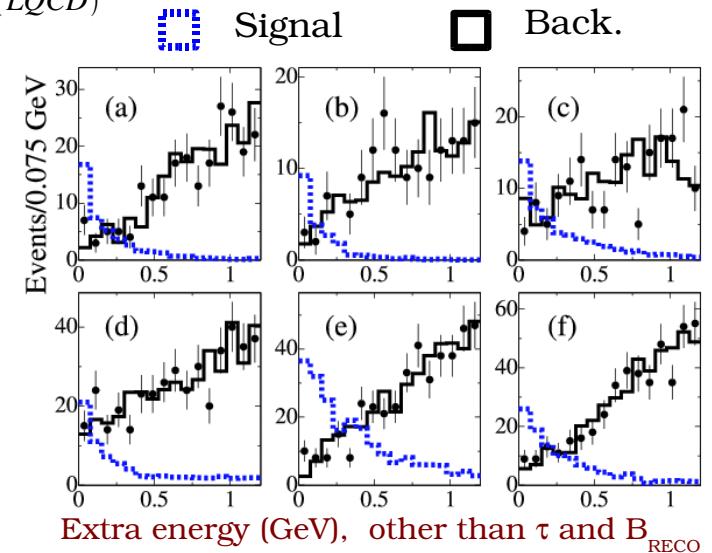

$f_B = 0.192 \pm 0.027 \text{ GeV (LQCD)}$

- Two (and more) neutrinos: no kin. constraints
- Look for 1/3 prongs τ decays on recoil of reconstructed $B^- \rightarrow D^{(*)} h/l\nu$

$$B(B \rightarrow \tau \nu) < 2.6 \cdot 10^{-4} \quad (90\% \text{ CL}) \quad BABAR (230 \text{ fb}^{-1})$$

$$B(B \rightarrow \tau \nu) < 1.8 \cdot 10^{-4} \quad (90\% \text{ CL}) \quad Belle (350 \text{ fb}^{-1})$$

- Weak Bound on UT

A Tree Process: $B^+ \rightarrow \tau^+ \nu_\tau$

$$\mathcal{B}(B^+ \rightarrow \tau^+ \nu_\tau) = \frac{G_F^2 m_B}{8\pi} m_\tau^2 \left(1 - \frac{m_\tau^2}{m_B^2}\right)^2 f_B^2 |V_{ub}|^2 \tau_B = (1.0 \pm 0.5) 10^{-4} \text{ UT-fit}$$

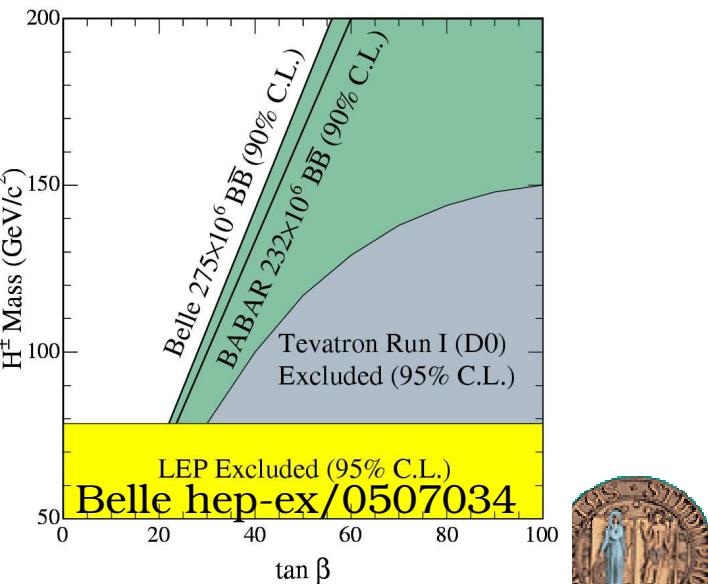

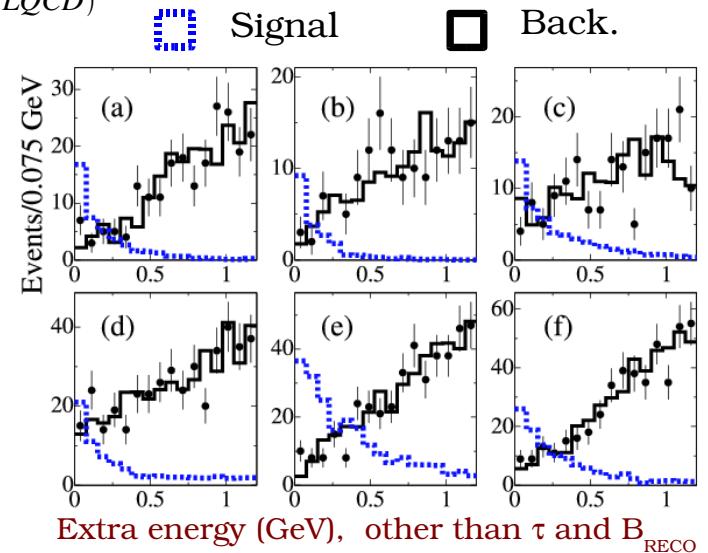

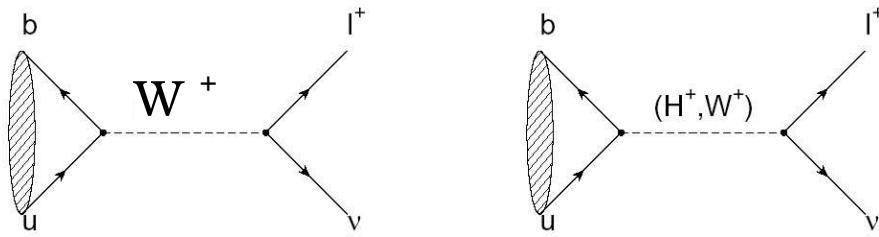

$f_B = 0.192 \pm 0.027 \text{ GeV (LQCD)}$

$$B(B \rightarrow \tau \nu) < 1.8 \cdot 10^{-4} \quad (90\% \text{ CL}) \quad Belle (350 \text{ fb}^{-1})$$

- Weak Bound on UT
- ... but improves considerably limits on H^+ from direct searches

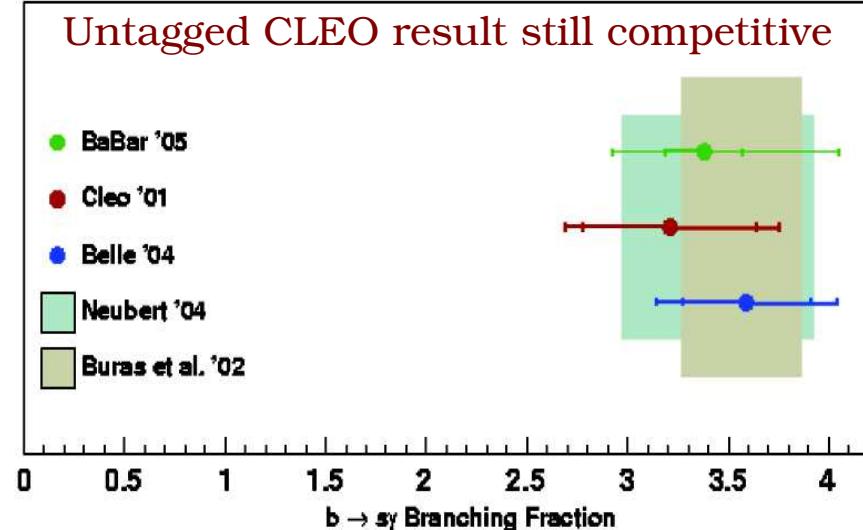

A Penguin Decay: $b \rightarrow \gamma s$

Continuum background reduction:

- * sum of 38 exclusive final states
- * high- p lepton tag
- * B_{RECO} (hadronic and semileptonic)

	<i>mode, E_γ cut</i>	$BR \times 10^4$
BABAR (80 fb $^{-1}$)	Σ exclusive, 1.9	$3.67 \pm 0.29 \pm 0.34 \pm 0.29$
BABAR (80 fb $^{-1}$)	inclusive, 1.6	$3.38 \pm 0.19^{+0.64}_{-0.41} \pm 0.08$
Belle (150 fb $^{-1}$)	inclusive, 1.8	$3.55 \pm 0.32 \pm 0.30^{+0.11}_{-0.07}$
W.A.		3.39 ± 0.30
S.M.	improved NLO	$3.47 \pm 0.37 \pm 0.31$

P.Gambino, M.Misiak Nucl.Phys. **B611** , 338 , 2001
M.Neubert, Eur.Phys.J. **C40** , 165 , 2005

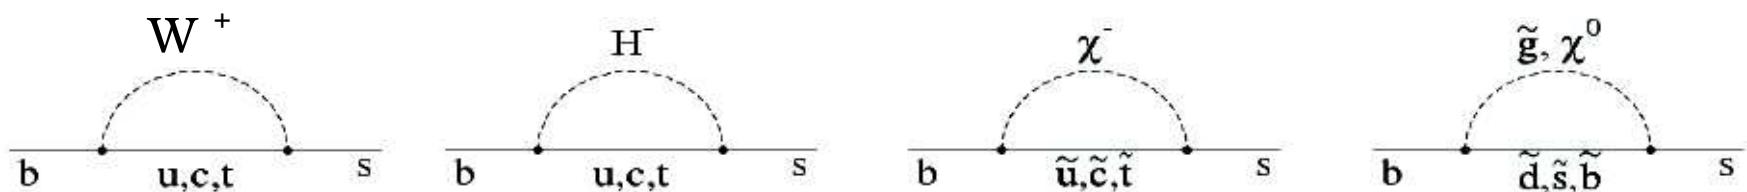

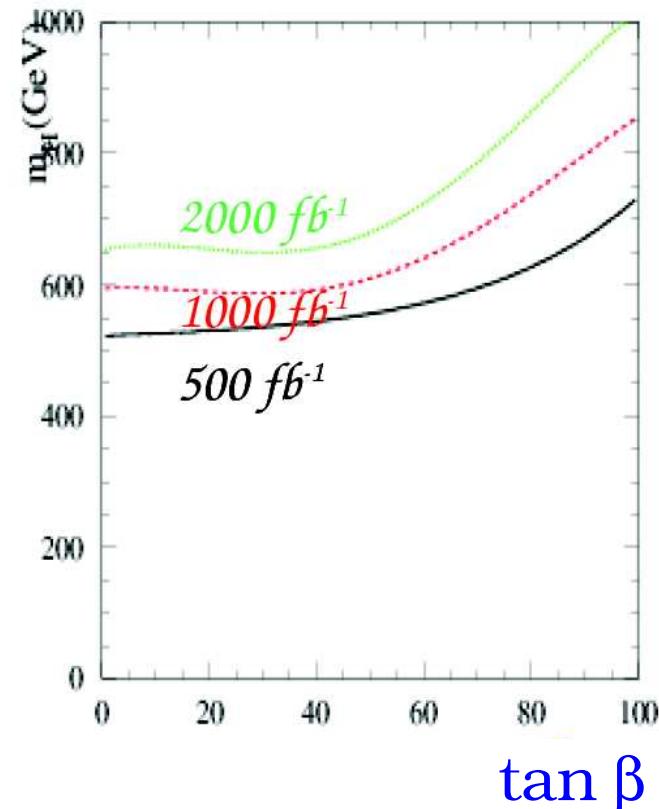

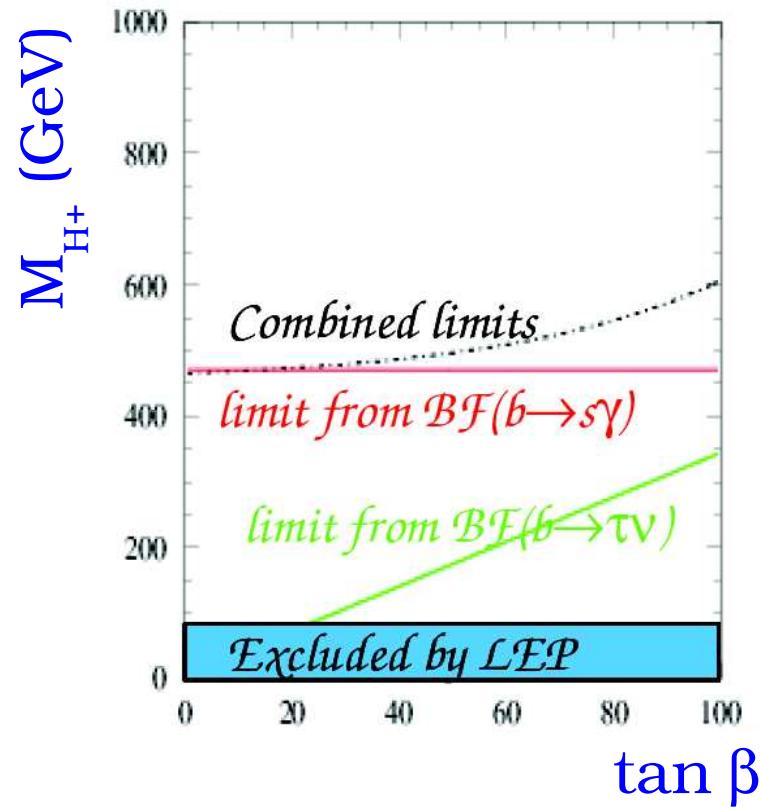

S.M holds well (once again ...)

A Penguin Decay: $b \rightarrow \gamma s$

... so improve limits on $M(H^+)$ further

based on 2DH model described in W.S.Hou Phys.Rev. **D48**, 2342, 1993

Motivation

- Very Rare Processes in the S.M.
- Current results from ν oscillation imply (at most)
$$\text{BR}(\tau \rightarrow \mu \gamma) \sim 10^{-54} !$$
- A smoking gun for New Physics

Role of B-factories

- B-factories are $c\bar{\tau}$ factories !
- $\sigma(\tau^+\tau^-) = 0.89 \text{ nb} \rightarrow 2 \cdot 10^8 \text{ evts / } 100 \text{ fb}^{-1}$
- Improve sensitivity by ~ 10 w.r.t. previous experiments

Lepton Flavour Violation

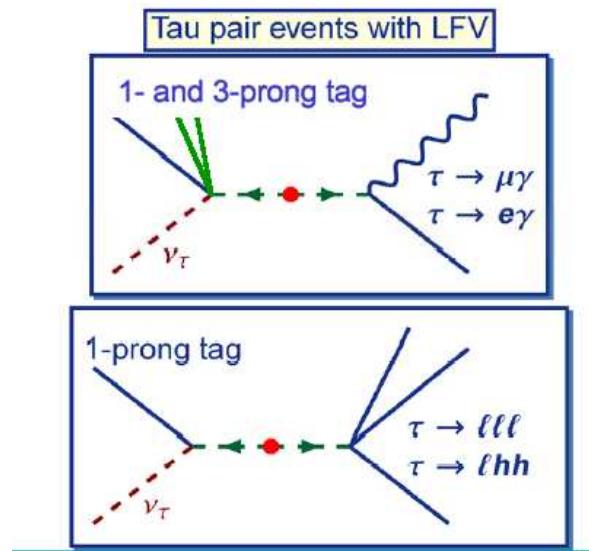

$\tau \rightarrow \mu\gamma$	PRL 95 (2005) 041802
$\tau \rightarrow e\gamma$	hep-ex/05080, accept. by PRL
$\tau \rightarrow 3\ell$	PRL 92 (2004) 121801
$\tau \rightarrow \ell hh'$	PRL 95 19, 191801

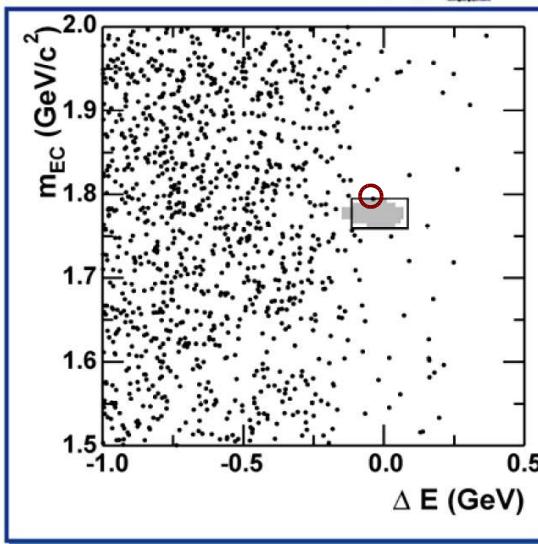

$\tau \rightarrow \mu\gamma$	PRL 92 (2004) 171802
$\tau \rightarrow e\gamma$	PLB 613 (2005) 22-28
$\tau \rightarrow 3\ell$	PLB 598 (2004) 103
$\tau \rightarrow \ell hh'$	Nu.Ph. B144 (2005) 173 (proc)
$\tau \rightarrow \ell K_s^0$	hep-ex/0509014
$\tau \rightarrow \ell^-(\pi^0, \eta, \eta')$	PLB 622 (2005) 218-228
$\tau \rightarrow \bar{\Lambda}\pi^-, \Lambda\pi^-$	to appear in PLB 632, 51, 2006

Means of the Searches

BABAR $\tau \rightarrow e\gamma$ search

- τ produced in pairs, in opposite hemispheres
- "tag-side", from one and three -prong τ decays
- "search-side", no ν : constrain

$$E_{vis} = \frac{\sqrt{s}}{2} \quad M_{vis} = M_\tau$$

- search-box $\sim 2 \sigma$ around constraint
- typical efficiency $\sim 5 \%$

- No significant excess observed (yet)
- Report best limit on the market (when >1 available)

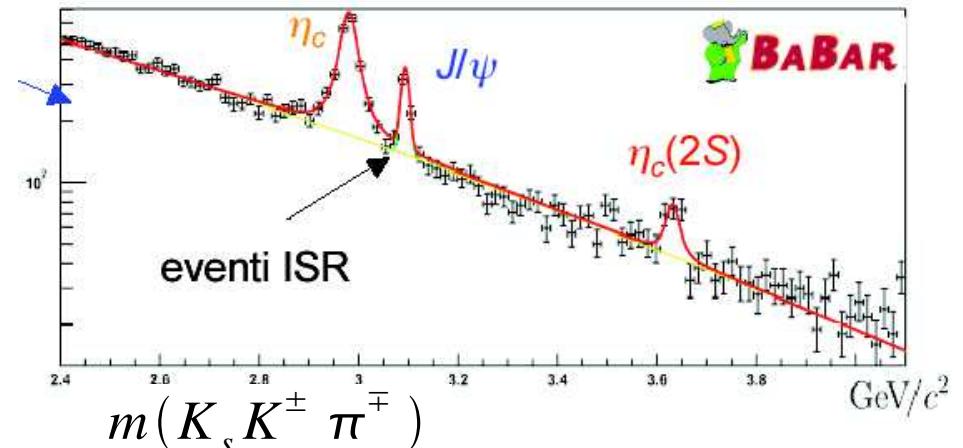

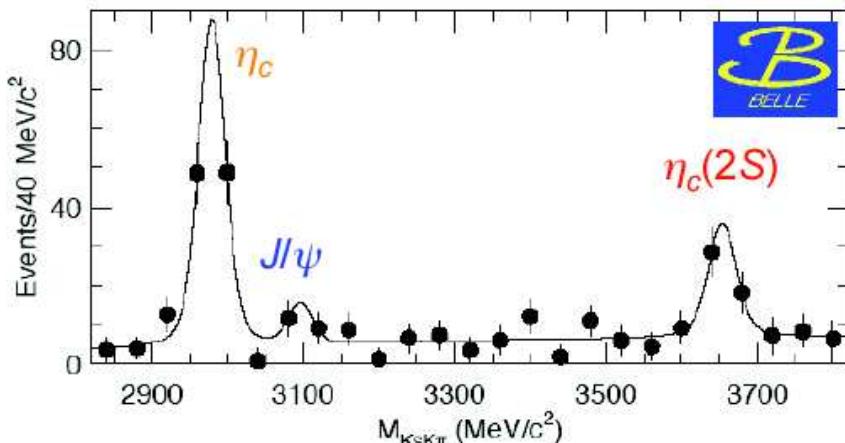

Mode	Exp. / Lum.	90% CL ($\times 10^{-7}$)	
$e\gamma$	<i>BABAR</i> (230 fb^{-1})	1.1	
$\mu\gamma$	<i>BABAR</i> (230 fb^{-1})	0.7	
$3l$	<i>BABAR</i> (90 fb^{-1})	1.1-3.3	
$3l$	<i>Belle</i> (90 fb^{-1})	1.9-3.5	
eK_s	<i>Belle</i> (280 fb^{-1})	0.6	
μK_s	<i>Belle</i> (280 fb^{-1})	0.5	
$l\pi^0, l\eta, l\eta'$	<i>Belle</i> (150 fb^{-1})	1.5 – 10.0	
$\bar{\Lambda}\pi^-$	<i>Belle</i> (150 fb^{-1})	1.4	B-L cons.
$\Lambda\pi^-$	<i>Belle</i> (150 fb^{-1})	0.7	B-L viol.

- ★ The Unitary Triangle by Sides
- ★ The Unitary Triangle by Angles
- ★ Search for N.P. & Constraints on the SM
- ★ **The Unexpected**
- ★ Conclusions & Perspectives

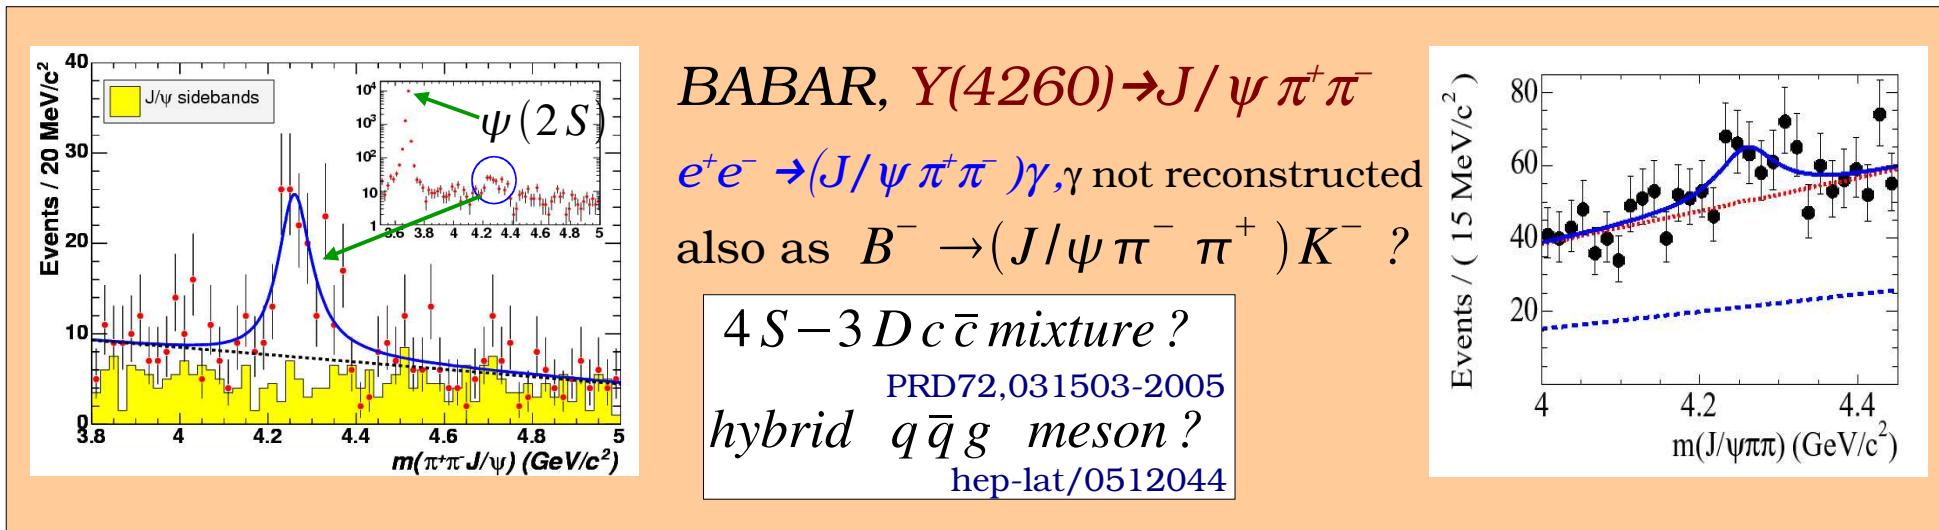

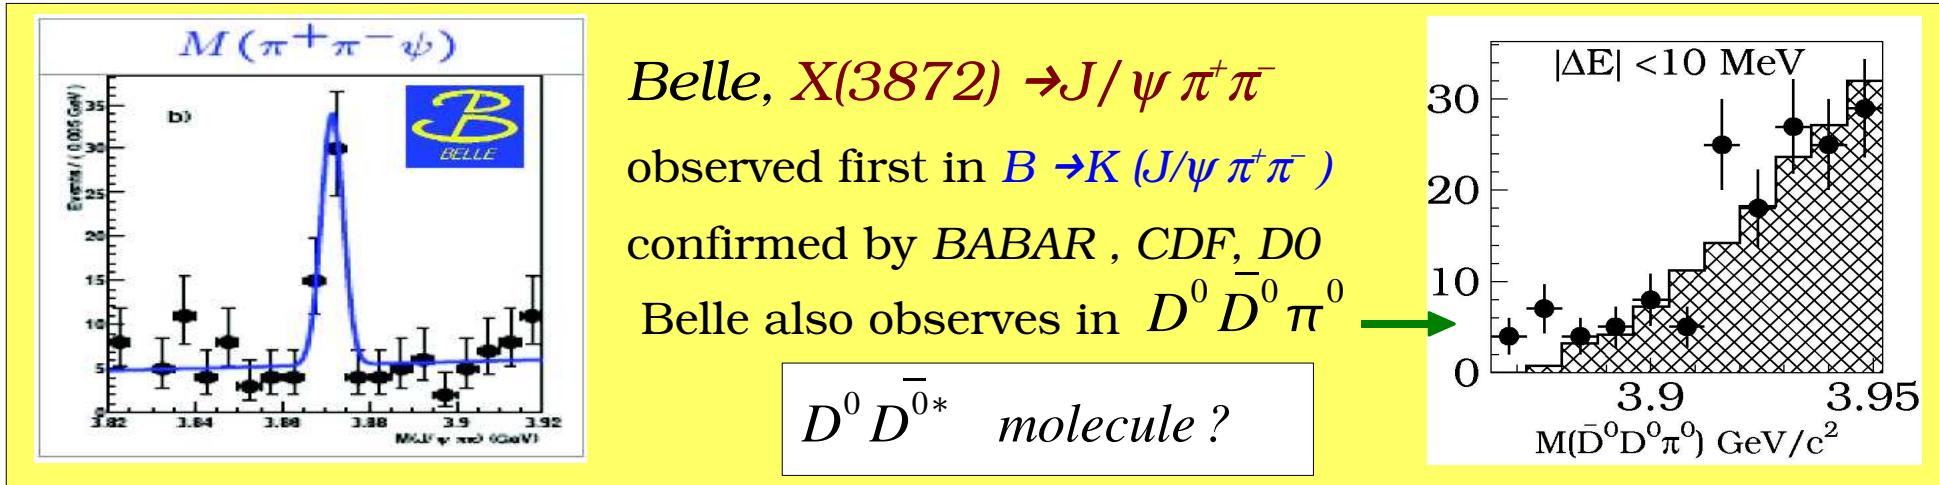

- Several new resonances have been observed
- Some good candidates for charmonium
- ... but also something else ...

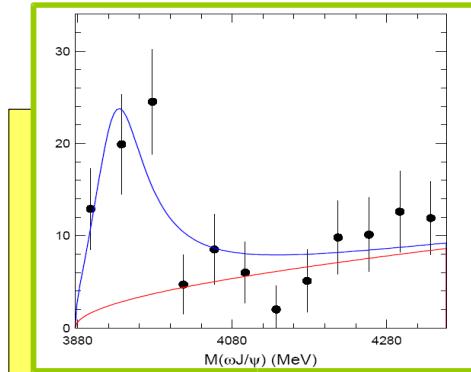

The Unexpected(1)

- ... not fitting any spectroscopic expectation !

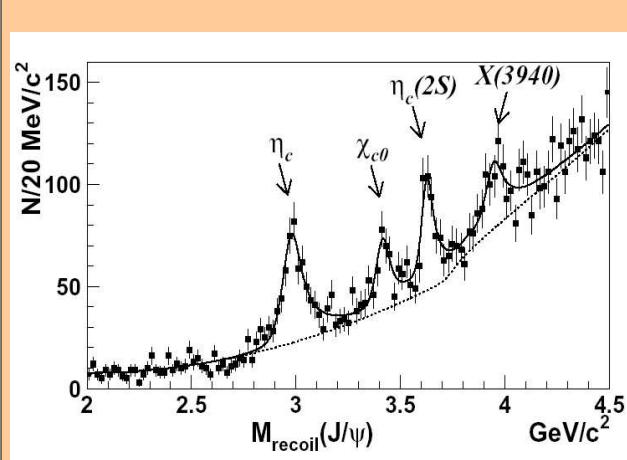

The Unexpected(2)

Belle, $Y(3940) \rightarrow J/\psi \omega$

observed as $B \rightarrow (J/\psi \omega) K$, also observed in continuum ?

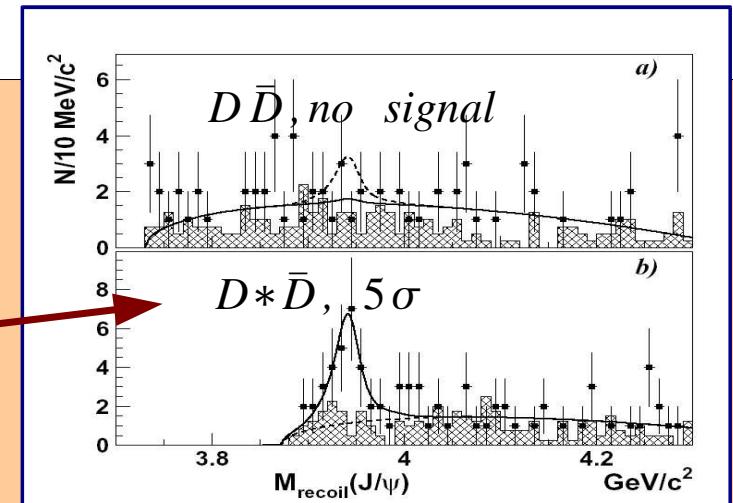

Belle, $ee \rightarrow J/\psi X$,

$X \rightarrow D^* D$ (only one D reconstructed)

but not :

$X \rightarrow J/\psi \omega$

- two different particles with equal mass ?

- Beauty Factories successfully pursue their program
- Collider performances and detector results outmatch expectations
- This notwithstanding
no crack in the S.M. (yet)
- However ...

Luminosity: Perspectives

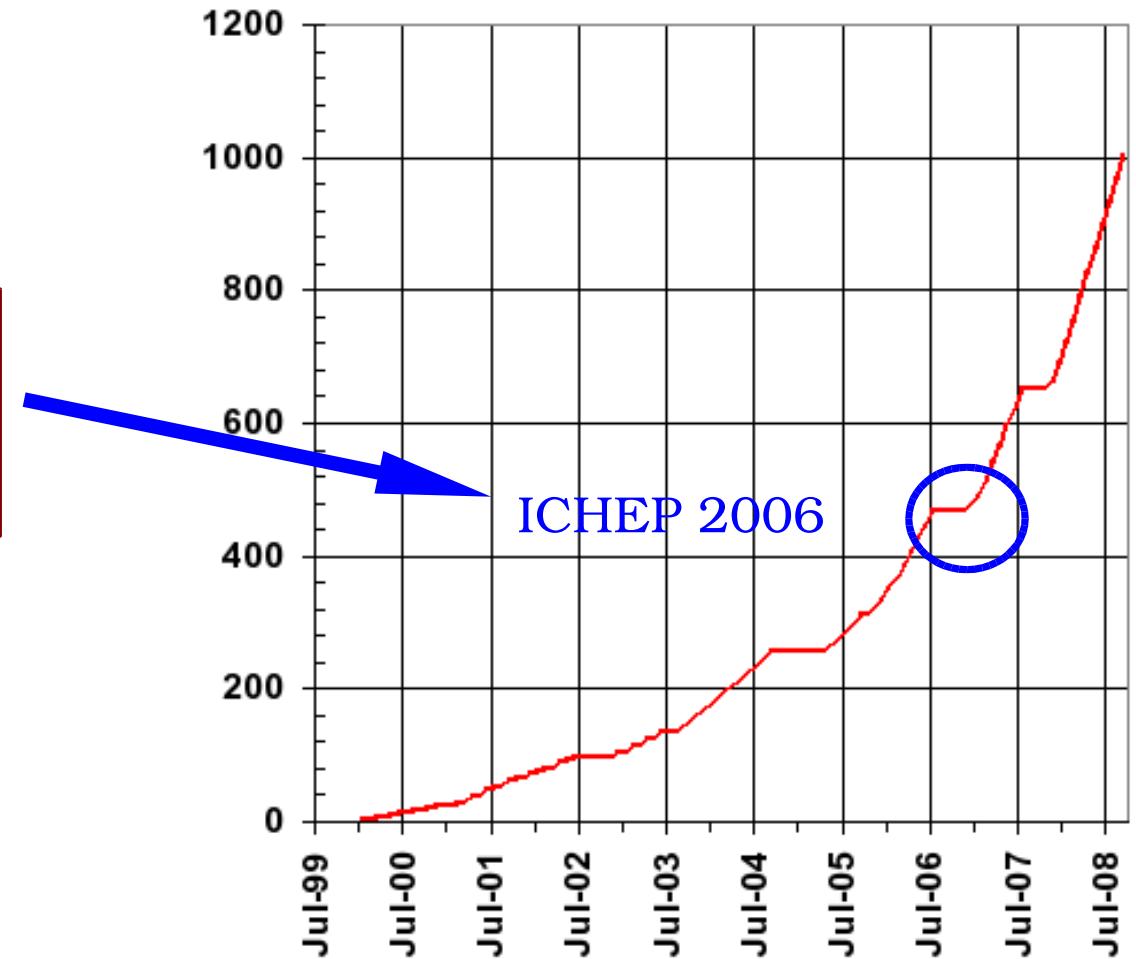

- KEK delivered 500 fb^{-1} before Jan /01/ 2006
- PEP II will cross 500 fb^{-1} by July 2006 (*x 2 results shown here*)
- By July 2008 $\sim 1 \text{ ab}^{-1}$ / experiment (*x4 -if approved*)

Luminosity: Perspectives

Mc Farlane P5 review:

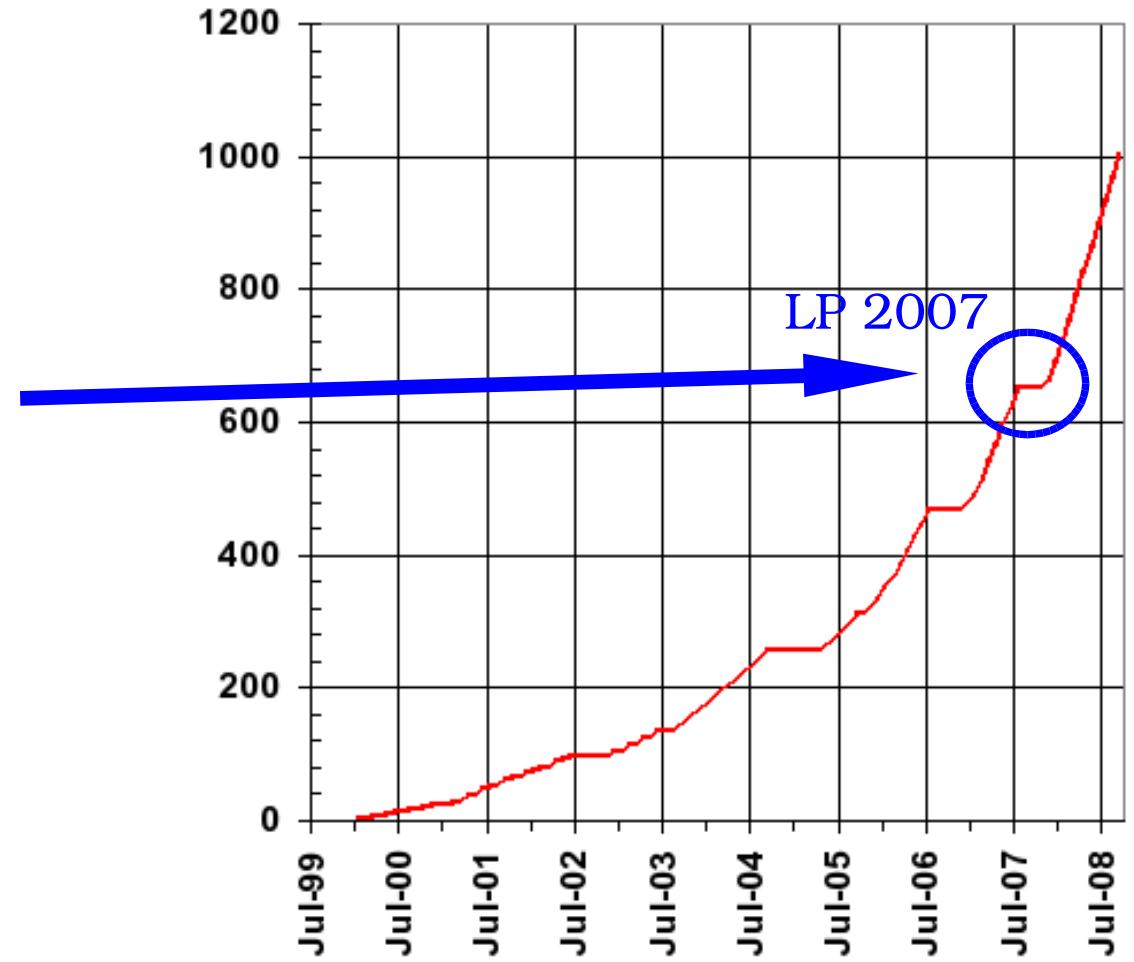

- $\sigma(V_{ub})$ (inclusive) $\sim 6.5\%$
- $\sigma(\gamma)$ Dalitz $\sim 10-15^0$

Luminosity: Perspectives

Mc Farlane P5 review:

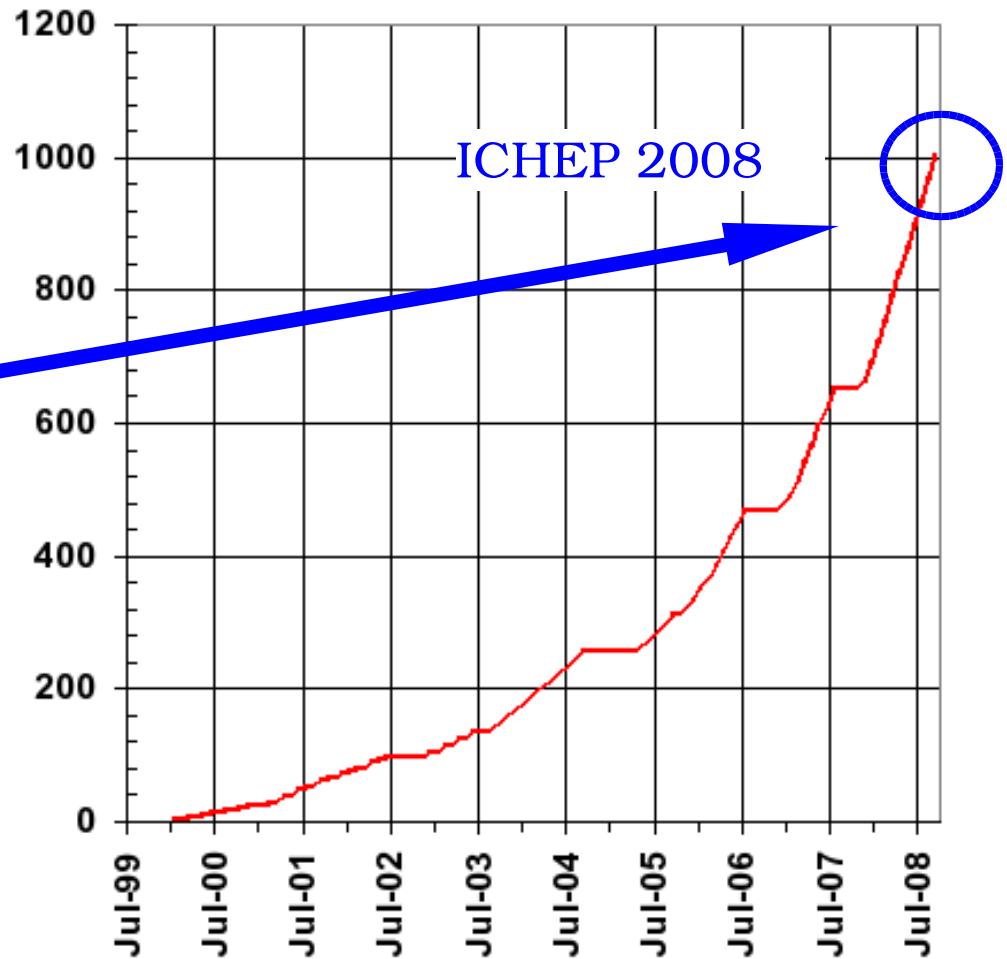

- discovery of $B \rightarrow \rho^0 \rho^0$
- V_{td} from $B \rightarrow \rho \gamma$

Luminosity: Perspectives

Mc Farlane P5 review:

- discovery of $B \rightarrow \tau\nu$
- asymmetry in $B \rightarrow \eta' K_S$ to 5σ
- $\sigma(V_{ub})$ (in+ex) < 5 %
- $\sigma(\gamma) < 10^0$

B-factories Physics Program "just started"
Stay Tuned !

BACKUP

X(3872) as a Charmonium state ?

- Unlikely : $\Gamma < 2.3 \text{ MeV}/c^2$ (90 CL)
- Possible narrow candidates
 - 1^3D_2 , 1^1D_2
 - ♠ expect radiative decay ($\chi_c \gamma$) which is not observed
 - 2^3P_1 , 2^1P_1
 - ♠ predicted 100 MeV heavier than X
 - ♠ not expected to decay into $J/\Psi \pi \pi$

PEPII status
